Question 1

Incorrect

Mark 0.00 out of 1.00

Question ID #10959: Cognitive-behavioral treatment for panic disorder involves interoceptive conditioning. This type of conditioning may include which of the following strategies?

Select one:

- ☒ A. Yelling "stop" whenever an undesirable thought occurs ✖ Incorrect
- ☐ B. Maintaining a panic diary
- ☐ C. Focusing on a pleasant experience or fantasy
- ☐ D. Breathing through a thin straw

The correct answer is D.

Interoceptive conditioning has been identified as an effective component of cognitive-behavioral therapy for the treatment of panic disorder. This intervention involves activity that generates physical sensations associated with panic attacks. Some examples of these activities include breathing through a thin straw, spinning in a swivel chair, and running in place.

Answer A: This option is incorrect, as it refers to a cognitive action rather than an activity that is aimed at producing a physical sensation associated with a panic attack.

Answer B: This answer is incorrect, as a panic diary is not intended to produce a physical sensation associated with a panic attack.

Answer C: This response is incorrect, as focusing attention on a pleasant thought is not intended to produce a physical sensation associated with a panic attack.

Question 2

Correct

Mark 1.00 out of 1.00

Question ID #11127: The assumption underlying dialectical behavioral therapy (Linehan, 1993) as a treatment modality for borderline personality disorder is that the symptoms of this disorder are caused by:

Select one:

- ☒ A. pervasive emotion dysregulation. ✓ Correct
- ☐ B. dysfunctional object relations.
- ☐ C. the depressive cognitive triad.
- ☐ D. a lack of response-contingent reinforcement.

The correct answer is A.

Dialectical behavioral therapy (DBT) was originally developed by Linehan (1993) as a treatment for borderline personality disorder and has since been applied to several other disorders, including eating disorders, ADHD in adults, and depression in older adults. According to Linehan, borderline personality disorder is the result of a combination of emotion dysregulation, emotional vulnerability, and an invalidating environment.

Answer B: DBT is primarily based upon cognitive-behavioral principles, and Linehan does not consider borderline personality disorder to be the result of dysfunctional object relations.

Answer C: DBT and CBT share some principles, but the cognitive triad has not been cited as Linehan's primary conceptualization of borderline personality disorder.

Answer D: Some behavioral models of depression describe the disorder as the result of a lack of response-contingent reinforcement. However, Linehan's explanation of borderline personality disorder is best described as the result of emotion dysregulation, emotional vulnerability, and an invalidating environment.

Question 3

Incorrect

Mark 0.00 out of 1.00

Question ID #11129: The revised learned helplessness model proposed by Abramson, Metalsky, and Alloy (1989) identifies _____ as the primary contributing factor for depression.

Select one:

- ☒ A. a high rate of self-punishment ✗ Incorrect
- ☐ B. emotional oversensitivity
- ☐ C. the depressive cognitive triad
- ☐ D. hopelessness

The correct answer is D.

In Abramson, Metalsky, and Alloy's (1989) version of the learned helplessness model, the authors assert that a sense of hopelessness is a proximal cause of some types of depression. Attributions about negative life events contribute to depression only to the degree that these attributions foster a sense of hopelessness.

Answer A: This answer is incorrect, as it references a different theory of depression. Rhem (1987) identified a high rate of self-punishment as a contributing factor to depression.

Answer B: Emotional oversensitivity is not a component of the learned helplessness model of depression.

Answer C: This response is incorrect, as Beck's (1976) "depressive cognitive triad" consists of negative, illogical self-statements about oneself, the world, and the future.

Question 4

Incorrect

Mark 0.00 out of 1.00

Question ID #11140: Desiree D., age 21, displays several active psychotic symptoms, including persecutory delusions, auditory hallucinations, incoherence, and loosening of associations. Her symptoms began suddenly three months ago, and she has no previous history of similar symptoms. Which of the following is the best diagnosis for her symptoms?

Select one:

- ☐ A. Schizophrenia
- ☒ B. Brief psychotic disorder ✖ Incorrect
- ☐ C. Schizoaffective disorder
- ☐ D. Schizophreniform disorder

The correct answer is D.

The disorders listed in the answers to this question share several characteristics; however, they also differ in terms of duration and/or certain key symptoms. Desiree's symptoms and their duration are most suggestive of schizophreniform disorder.

Answer A: Although Desiree's symptoms are consistent with some criteria of schizophrenia, they do not meet the DSM-5 diagnostic requirement of a duration of at least six months.

Answer B: The duration of brief psychotic disorder is from one day to one month, whereas Desiree's symptoms have been present for three months.

Answer C: For a diagnosis of schizoaffective disorder, mood symptoms must co-occur with psychotic symptoms except during a period of at least two weeks, in which delusions or hallucinations are present without prominent mood symptoms.

Question 5

Incorrect

Mark 0.00 out of 1.00

Question ID #11141: The prognosis for a child with autism is best if the child:

Select one:

- ☐ A. does not have delays in motor development.
- ☐ B. displays some ability to communicate verbally by age five or six.
- ☐ C. has one or more savant abilities.
- ☒ D. does not have a family history of a mental disorder. ✖ Incorrect

The correct answer is B.

Most individuals who are diagnosed with autism continue to have significant impairments throughout their lives. However, a better prognosis has been linked to the ability to communicate verbally by age five or six, an IQ of 70 or above, and later onset of symptoms.

Answers A, C, and D: These options are incorrect. The ability to communicate verbally by age five or six provides a better prognosis for individuals diagnosed with autism.

Question 6

Correct

Mark 1.00 out of 1.00

Question ID #11146: The diagnosis of cyclothymic disorder for children and adolescents requires the presence of symptoms for at least:

Select one:

- ☐ A. six months.
- ☒ B. twelve months. ✓ Correct
- ☐ C. twenty-four months.
- ☐ D. thirty-six months.

The correct answer is B.

Cyclothymic disorder is characterized by a disturbance of mood involving hypomanic episodes and periods of depressed mood. The DSM-5 diagnosis of cyclothymic disorder requires the presence of symptoms for at least two years in adults and one year in children and adolescents.

Answers A, C, and D: The diagnosis of Cyclothymic disorder in children and adolescents requires the presence of symptoms for at least one year.

Question 7

Correct

Mark 1.00 out of 1.00

Question ID #11154: The DSM-5 diagnosis of bipolar II disorder requires which of the following?

Select one:

- ☐ A. One or more manic episodes
- ☐ B. One or more mixed episodes
- ☐ C. Manic and major depressive episodes
- ☒ D. Hypomanic and major depressive episodes ✓ Correct

The correct answer is D.

The diagnosis of Bipolar II disorder requires at least one major depressive episode and at least one hypomanic episode.

Answers A, B, and C: These options are incorrect, as the diagnosis of Bipolar II disorder requires at least one major depressive episode and at least one hypomanic episode.

Question 8

Correct

Mark 1.00 out of 1.00

Question ID #11155: Based on DSM-5 criteria, the diagnosis of attention-deficit/hyperactivity disorder (ADHD) requires which of the following?

Select one:

- ☐ A. The onset of symptoms prior to 4 years of age
- ☒ B. Duration of symptoms of at least 6 months ✓ Correct
- ☐ C. Markedly impaired academic performance
- ☐ D. Negativistic, hostile, and defiant behavior

The correct answer is B.

Of the diagnostic criteria listed in the answers, symptom duration of at least 6 months is the only required DSM-5 criterion for a diagnosis of ADHD.

Answers A, C, and D: These answers are not required criteria for the diagnosis of ADHD.

Question 9

Incorrect

Mark 0.00 out of 1.00

Question ID #11156: According to the catecholamine hypothesis:

Select one:

- ☐ A. mania is due to a deficiency in norepinephrine.
- ☐ B. depression is due to a deficiency in norepinephrine.
- ☒ C. mania is due to excessive acetylcholine. ✗ Incorrect
- ☐ D. depression is due to excessive acetylcholine.

The correct answer is B.

According to the catecholamine hypothesis, some types of depression are due to a lower-than-normal level of norepinephrine.

Answer A: The catecholamine hypothesis predicts that mania results from excessive norepinephrine, not a deficiency of it.

Answer C: The catecholamine hypothesis proposes that mania is due to excessive norepinephrine, not excessive acetylcholine.

Answer D: According to the catecholamine hypothesis, some depression results from lower-than-normal levels of norepinephrine, not from excessive acetylcholine.

Question 10

Correct

Mark 1.00 out of 1.00

Question ID #11165: The prognosis for schizophrenia has been linked to several factors. Which of the following is NOT associated with a better prognosis?

Select one:

- ☐ A. Acute and late onset of the disorder
- ☐ B. The presence of a precipitating event
- ☐ C. Family history of a mood disorder
- ☒ D. Male gender ✓ Correct

The correct answer is D.

The course of schizophrenia varies from individual to individual. However, research has identified several factors that are associated with a better prognosis, including female gender, acute and late onset of symptoms, the presence of a precipitating event, and family history of a mood disorder. Male gender is NOT associated with a better prognosis.

Answer A: An acute and late onset of the disorder has been linked to better outcomes.

Answer B: The presence of a precipitating event is correlated with improved prognosis.

Answer C: A family history of a mood disorder is associated with a better prognosis.

Question 11

Incorrect

Mark 0.00 out of 1.00

Question ID #11167: The most effective treatment for obsessive-compulsive disorder is:

Select one:

- ☐ A. exposure therapy with response prevention.
- ☐ B. stress management with relaxation training.
- ☒ C. covert sensitization. ✗ Incorrect
- ☐ D. stress inoculation training.

The correct answer is A.

The treatment of choice for OCD is exposure with response prevention. This intervention involves exposing the individual to anxiety-arousing stimuli while prohibiting him or her from engaging in usual anxiety-reducing responses (compulsions).

Answers B, C, and D: These treatments are not considered as effective as exposure with response prevention.

Question 12

Correct

Mark 1.00 out of 1.00

Question ID #11194: A 45-year old woman exhibits several symptoms including autonomic hyperactivity, hand tremor, and nausea following cessation of prolonged and heavy alcohol use. A diagnosis of alcohol withdrawal delirium would be more appropriate than a diagnosis of alcohol withdrawal if the woman also exhibits:

Select one:

- ☐ A. psychomotor agitation.
- ☐ B. tonic-clonic seizures.
- ☒ C. impaired attention and awareness. ✓ Correct
- ☐ D. tardive dyskinesia.

The correct answer is C.

The key to identifying the correct answer to this question is to know that disturbances in attention and awareness are essential features of delirium. Alcohol withdrawal delirium is also known as delirium tremens (DTs) and may include vivid hallucinations, delusions, autonomic hyperactivity, and agitation.

Answer A: Psychomotor agitation is characteristic of alcohol withdrawal.

Answer B: In extreme cases, alcohol withdrawal may involve tonic-clonic seizures.

Answer D: Tardive dyskinesia is not a symptom of delirium.

Question 13

Correct

Mark 1.00 out of 1.00

Question ID #11225: According to Marlatt and Gordon (1985), which of the following result(s) from an "overlearned habit pattern"?

Select one:

- ☐ A. Parasuicidal behavior
- ☒ B. Addictive behavior ✓ Correct
- ☐ C. Hypochondriasis
- ☐ D. Paraphilias

The correct answer is B.

Marlatt and Gordon (1985) assert that addictive behaviors result from overlearned maladaptive habit patterns that have developed because they produce immediate gratification (reinforcement).

Answer A: Marlatt and Gordon's theory pertains to addictive behaviors, not parasuicidal behavior.

Answer C: Marlatt and Gordon's theory pertains to addictive behaviors, not hypochondriasis.

Answer D: Marlatt and Gordon's theory pertains to addictive behaviors, not paraphilias.

Question 14

Incorrect

Mark 0.00 out of 1.00

Question ID #12989: Children with Tourette syndrome frequently exhibit significant problems in learning. This is most likely attributable to:

Select one:

- ☐ A. language disabilities.
- ☐ B. attention deficits and hyperactivity.
- ☐ C. lower-than-average IQ.
- ☒ D. peer and other social problems. ✖ Incorrect

The correct answer is B.

Individuals diagnosed with Tourette syndrome commonly report symptoms of hyperactivity, distractibility, and impulsivity, and these symptoms have been identified as contributing factors to academic problems.

Answer A: Language disabilities are not associated with Tourette syndrome.

Answer C: A lower-than-average IQ is not characteristic of Tourette syndrome.

Answer D: Impairments in social functioning are common; however, they have not been identified as a cause of academic failures.

Question 15

Correct

Mark 1.00 out of 1.00

Question ID #13334: A DSM-5 diagnosis of specific learning disorder requires the individual's academic skills to be substantially below those expected for their:

Select one:

- ☒ A. chronological age. ✔ Correct
- ☐ B. mental age.
- ☐ C. measured intelligence.
- ☐ D. academic aptitude.

The correct answer is A.

A DSM-5 diagnosis of specific learning disorder requires the individual's academic skills to be "substantially and quantifiably below those expected for the individual's chronological age" (APA, 2013, p. 67).

Answers B, C, and D: These options are incorrect, as a diagnosis of specific learning disorder requires the individual's academic skills to be "substantially and quantifiably below those expected for the individual's chronological age" (APA, 2013, p. 67).

Question 16

Incorrect

Mark 0.00 out of 1.00

Question ID #13335: As described in the DSM-5, a manic episode involves a period of abnormally and persistently elevated, expansive, or irritable mood and:

Select one:

- ☐ A. inflated self-esteem or grandiosity.
- ☐ B. persistently increased activity or energy.
- ☒ C. involvement in activities that have a high potential for negative consequences. ✖ Incorrect
- ☐ D. anxious distress.

The correct answer is B.

Criterion A for a manic episode includes "a distinct period of abnormally and persistently elevated, expansive, or irritable mood and abnormally and persistently increased goal-directed activity or energy (APA, 2013, p.124)."

Answer A: Inflated self-esteem and grandiosity are possible symptoms of a manic episode; however, they are not required.

Answer C: Involvement in activities that have a high potential for negative consequences is a possible symptom of a manic episode; however, it is not required.

Answer D: Anxious distress is a possible accompanying symptom of bipolar I disorder, and "with anxious distress" is included in the DSM-5 as a specifier for the diagnosis.

Question 17

Correct

Mark 1.00 out of 1.00

Question ID #13336: Ethel E., age 36, has just been offered a promotion at work. Although she wants the increase in salary and prestige of the new position, she is planning to turn down the job because it will require extensive speaking in front of large groups of employees. Ethel has avoided situations that require her to speak to groups for as long as she can remember because public speaking is a very embarrassing experience for her. Whenever she has to speak in front of others, she is extremely anxious, her heart races, her palms become sweaty, and she becomes preoccupied with the concern that she will forget what she has planned to say. Ethel's symptoms are most suggestive of which of the following disorders?

Select one:

- ☐ A. Panic disorder
- ☒ B. Social anxiety disorder ✓ Correct
- ☐ C. Avoidant personality disorder
- ☐ D. Obsessive-compulsive personality disorder

The correct answer is B.

Of the disorders listed, Ethel's symptoms are most consistent with a DSM-5 diagnosis of social anxiety disorder (social phobia). She has an intense fear of a specific social situation (public speaking) because it exposes her to scrutiny by others. Consequently, she avoids the situation.

Answer A: The diagnosis of panic disorder requires recurrent unexpected panic attacks. Although Ethel's symptoms are consistent with panic attacks, they are linked to a specific situation and are not unexpected.

Answer C: While some of Ethel's symptoms are consistent with avoidant personality disorder, Answer B is a better choice because her intense fear of a specific social situation exposes Ethel to potential scrutiny and leads her to avoid the promotion.

Answer D: Ethel's symptoms are not characteristic of obsessive-compulsive personality disorder.

Question 18

Correct

Mark 1.00 out of 1.00

Question ID #13337: The prevalence rates of major depressive disorder are about equal for boys and girls before puberty. In adolescents and adults:

Select one:

- ☐ A. the rates for males and females remain about equal.
- ☒ B. the rate for females is about 1.5 to 3 times the rate for males. ✓ Correct
- ☐ C. the rate for females is about 4 to 5 times the rate for males.
- ☐ D. the rate for males is about 2 to 3 times the rate for females.

The correct answer is B.

According to the DSM-5, beginning in early adolescence, the rate of major depressive disorder for females is 1.5 to 3 times the rate for males.

Answers A, C, and D: These options are incorrect. According to the DSM-5, beginning in early adolescence, the rate of major depressive disorder for females is 1.5 to 3 times the rate for males.

Question 19

Correct

Mark 1.00 out of 1.00

Question ID #13338: A psychologist should not assign a diagnosis of disruptive mood dysregulation disorder for the first time if the individual is younger than ____ years of age or older than ____.

Select one:

- ☐ A. three; fifteen
- ☐ B. five; sixteen
- ☒ C. six; eighteen ✓ Correct
- ☐ D. ten; eighteen

The correct answer is C.

As described in the DSM-5, the diagnosis of disruptive mood dysregulation disorder must not be assigned for the first time when the individual is less than six years of age or more than 18 years of age, and the onset of symptoms must occur before age 10.

Answers A, B, and D: These options are incorrect. A diagnosis of disruptive mood dysregulation disorder must not be assigned for the first time when the individual is less than six years of age or more than 18 years of age.

Question 20

Incorrect

Mark 0.00 out of 1.00

Question ID #13339: Research outcomes have linked obsessive-compulsive disorder to overactivity in which of the following?

Select one:

- ☐ A. Caudate nucleus
- ☒ B. Hippocampus ✗ Incorrect
- ☐ C. Suprachiasmatic nucleus
- ☐ D. Medulla oblongata

The correct answer is A.

Research findings using brain imaging techniques have demonstrated that the caudate nucleus (which is involved in the initiation and control of movement) tends to be overactive in individuals with OCD. Studies have also indicated that the reduction of obsessions and compulsions following treatment with cognitive-behavioral therapy or an SSRI is accompanied by a decrease in activity in the caudate nucleus.

Answer B: The hippocampus is associated with learning and memory.

Answer C: The suprachiasmatic nucleus regulates circadian rhythms.

Answer D: The medulla oblongata controls autonomic (involuntary) functions such as breathing, eating, and heart rate.

Question 21

Incorrect

Mark 0.00 out of 1.00

Question ID #13340: A DSM-5 diagnosis of somatic symptom disorder requires the presence of one or more somatic symptoms that are distressing or cause significant disruption in daily life plus:

Select one:

- ☒ A. evidence that symptoms are not associated with a known medical condition. ✖ Incorrect
- ☐ B. performance of excessive health-related behaviors or maladaptive avoidance of medical care.
- ☐ C. evidence that symptoms are not being feigned or voluntarily produced.
- ☐ D. excessive thoughts, feelings, or behaviors related to the symptoms.

The correct answer is D.

Criterion B for the DSM-5 diagnosis of somatic symptom disorder requires the presence of "excessive thoughts, feelings, or behaviors related to the somatic symptoms or associated health concerns" (APA, 2013, p. 311).

Answer A: Symptoms may or may not be associated with a medical condition for the diagnosis of somatic symptom disorder.

Answer B: Performance of excessive health-related behaviors or maladaptive avoidance of medical care is a diagnostic criterion for illness anxiety disorder.

Answer C: Evidence that symptoms are not being intentionally produced or feigned is not required for a DSM-5 diagnosis of somatic symptom disorder.

Question 22

Incorrect

Mark 0.00 out of 1.00

Question ID #13341: In the DSM-5, sleep terror is included:

Select one:

- ☒ A. with the sleep-wake disorders as a separate diagnosis. ✖ Incorrect
- ☐ B. as a type of rapid eye movement sleep behavior disorder.
- ☐ C. as a type of non-rapid eye movement sleep arousal disorder.
- ☐ D. as a specifier for nightmare disorder.

The correct answer is C.

In the DSM-5, sleep terror is a type of non-rapid eye movement sleep arousal disorder. Sleepwalking is the other type of sleep arousal disorder in this category.

Answers A, B, and D: Sleep terror is categorized as a type of non-rapid eye movement sleep arousal disorder.

Question 23

Correct

Mark 1.00 out of 1.00

Question ID #13342: Drugs that interfere with the breakdown of _____ are used to treat memory loss and other cognitive problems in individuals with mild to moderate Alzheimer's disease.

Select one:

- ☐ A. norepinephrine
- ☐ B. cortisol
- ☒ C. acetylcholine ✓ Correct
- ☐ D. dopamine

The correct answer is C.

Cholinesterase inhibitors such as donepezil (Aricept), galantamine (Reminyl), and tacrine (Cognex) are used to temporarily improve or slow the progression of memory loss and other cognitive impairments during early stages of Alzheimer's disease. These drugs prevent the breakdown of acetylcholine, which is important for learning, memory, and other cognitive functions.

Answer A: Cholinesterase inhibitors are typically used to treat Alzheimer's disease by preventing the breakdown of acetylcholine, not norepinephrine.

Answer B: Cholinesterase inhibitors are typically used to treat Alzheimer's disease by preventing the breakdown of acetylcholine, not cortisol.

Answer D: Cholinesterase inhibitors are typically used to treat Alzheimer's disease by preventing the breakdown of acetylcholine, not dopamine.

Question 24

Incorrect

Mark 0.00 out of 1.00

Question ID #13343: The differential diagnosis of major depressive disorder and mild neurocognitive disorder in older adults can be difficult because of the overlap in cognitive symptoms. However, the presence of which of the following suggests that major depressive disorder is the more appropriate diagnosis?

Select one:

- ☒ A. The onset of the patient's cognitive symptoms was insidious. ✖ Incorrect
- ☐ B. The severity of the patient's cognitive symptoms increases in the evening.
- ☐ C. The patient seems unaware of their cognitive deficits.
- ☐ D. The patient is uncooperative during cognitive testing.

The correct answer is D.

A lack of cooperation during testing is more characteristic of patients with depression than of those with a neurocognitive disorder, who tend to be cooperative but inaccurate in their responses.

Answer A: In major depressive disorder, symptom onset is usually sudden, but in mild neurocognitive disorder, it is typically insidious (gradual and subtle).

Answer B: Increased severity of symptoms in the evening is characteristic of some forms of neurocognitive disorder but is uncommon in major depressive disorder.

Answer C: A patient with major depressive disorder is likely to complain about and exaggerate their cognitive problems, while a patient with a neurocognitive disorder often denies problems in the early stage of the disorder and is unaware of them in the later stages.

Question 25

Incorrect

Mark 0.00 out of 1.00

Question ID #13344: Rosita R., age 32, maintains systematized paranoid delusions despite a lack of evidence for her beliefs. However, she shows almost no impairment in daily functioning other than some problems that are directly related to her delusions. The symptoms began six months ago shortly after she was fired from her job. The most likely DSM-5 diagnosis for Rosita is:

Select one:

- ☐ A. paranoid schizophrenia.
- ☒ B. acute stress disorder. ✖ Incorrect
- ☐ C. conversion disorder.
- ☐ D. delusional disorder.

The correct answer is D.

Rosita's delusions are consistent with delusional disorder because she believes them despite a lack of evidence, and because the effects of the delusions on her functioning are circumscribed (they affect only those aspects of functioning that are directly related to the delusion).

Answer A: Paranoid schizophrenia is not a DSM-5 diagnosis.

Answer B: A diagnosis of acute stress disorder requires exposure to actual or threatened death, severe injury, or sexual violation and the presence of at least nine symptoms from any of five categories (i.e., intrusion, negative mood, dissociative symptoms, avoidance symptoms, arousal symptoms).

Answer C: A diagnosis of conversion disorder requires a disturbance in voluntary motor or sensory functioning that suggests a serious neurological or other medical condition (e.g., paralysis, seizures, blindness, loss of pain sensation) with evidence of an incompatibility between the symptom and recognized neurological and medical conditions.

Question 26

Correct

Mark 1.00 out of 1.00

Question ID #13345: A DSM-5 diagnosis of erectile disorder requires the presence of characteristic symptoms for a minimum duration of approximately ____ months.

Select one:

- ☐ A. two
- ☒ B. six ✔ Correct
- ☐ C. ten
- ☐ D. twelve

The correct answer is B.

The DSM-5 requires the presence of characteristic symptoms for a minimum duration of about six months for all the sexual dysfunctions, except substance/medication-induced sexual dysfunction, for which no minimum duration is specified.

Answers A, C, and D: A diagnosis of erectile disorder requires the presence of characteristic symptoms for a minimum duration of six months.

Question 27

Correct

Mark 1.00 out of 1.00

Question ID #13378: A better prognosis for schizophrenia is associated with all of the following except:

Select one:

- ☐ A. female gender.
- ☒ B. an early onset of symptoms. ✓ Correct
- ☐ C. a family history of a mood disorder.
- ☐ D. the presence of a precipitating event.

The correct answer is B.

A late (not early) onset of symptoms is associated with a better prognosis.

Answer A: Female gender is associated with a better prognosis of schizophrenia.

Answer C: A family history of a mood disorder is associated with a better prognosis of schizophrenia.

Answer D: The presence of a precipitating event is correlated with a better prognosis of schizophrenia.

Question 28

Incorrect

Mark 0.00 out of 1.00

Question ID #13563: In the DSM-5, the symptoms of oppositional defiant disorder are categorized into three groups. These groups are:

Select one:

- ☐ A. destruction of property, deceitfulness or theft, and serious violations of rules.
- ☐ B. negativistic, defiant, and hostile behavior.
- ☒ C. deceitfulness/dishonesty, irritability/aggressiveness, and failure to conform to social norms. ✗ Incorrect
- ☐ D. angry/irritable mood, argumentative/defiant behavior, and vindictiveness.

The correct answer is D.

Angry/irritable mood, argumentative/defiant behavior, and vindictiveness are the three categories of symptoms included in the DSM-5 for oppositional defiant disorder.

Answer A: These are three of the four categories of symptoms included in the DSM-5 for conduct disorder (the fourth is aggression to people and animals).

Answer B: These are the incorrect categories of symptoms included in the DSM-5 for oppositional defiant disorder.

Answer C: These are the incorrect categories of symptoms included in the DSM-5 for oppositional defiant disorder.

Question 29

Incorrect

Mark 0.00 out of 1.00

Question ID #10206: In Berry's bidirectional acculturation model (1993), _____ is characterized by low involvement in one's own minority culture and in the majority culture.

Select one:

- ☐ A. moratorium
- ☐ B. alienation
- ☒ C. separation ✖ Incorrect
- ☐ D. marginalization

The correct answer is D.

Berry (1993) distinguishes between two independent dimensions in his discussion of acculturation: involvement in one's minority culture and involvement in the majority culture. Marginalization occurs when a member of a minority group is uninvolved in both cultures.

Answer A: Moratorium is not one of Berry's four acculturation status categories.

Answer B: Alienation is not one of Berry's four acculturation status categories.

Answer C: Berry asserts that separation involves withdrawal from the dominant culture and acceptance of one's own culture.

Question 30

Incorrect

Mark 0.00 out of 1.00

Question ID #10534: Freud described countertransference as the analyst's transference to the patient, which may interfere with the analyst's functioning in therapy. More recently, psychoanalysts have begun to view countertransference as:

Select one:

- ☐ A. a detriment to the normal progression of therapy.
- ☐ B. a potential source of information about the client.
- ☐ C. an analyst's distortion of the client's behavior.
- ☒ D. an opportunity for the analyst to respond to the client in an authentic way. ✖ Incorrect

The correct answer is B.

Psychoanalysts have broadened their view of countertransference over the past few decades. Most analysts now believe that countertransference reactions originate as much (or more) from the patient as from the analyst. Consequently, countertransference is now viewed as a potentially beneficial way to gain insight into the patient's inner world (Gabbard, 1995; Langs, 1982).

Answer A: Modern analysts believe that countertransference can positively aid the progression of therapy rather than serving as a detriment to treatment.

Answer C: Freud viewed countertransference as the therapist's distorted response to the client. However, modern analysts consider countertransference to be a potential source of information about the client that can be an important factor in the curative process.

Answer D: This is not the best answer. Answer B constitutes a more definitive distinction between a modern view and a traditional Freudian view of countertransference in therapy.

Question 31

Incorrect

Mark 0.00 out of 1.00

Question ID #10916: Researchers interested in evaluating the outcomes of psychotherapy distinguish between effectiveness and efficacy research. In contrast to effectiveness research, efficacy research:

Select one:

- ☐ A. has better internal validity but limited external validity.
- ☐ B. has limited internal validity but better external validity.
- ☒ C. has better internal and external validity. ✗ Incorrect
- ☐ D. has limited internal and external validity.

The correct answer is A.

Efficacy studies are conducted in well-controlled conditions, often using a structured manualized session format. In contrast, effectiveness studies are conducted in real-world settings with less experimental control. Therefore, while efficacy studies are useful for determining whether a treatment has beneficial effects under controlled conditions, effectiveness studies are useful for determining if those effects generalize to other conditions. (Note that to identify the correct answer to this question, you not only have to be familiar with efficacy and effectiveness research, but also with internal and external validity, which are described in the Statistics and Research Design chapter of the written study materials.)

Answer B: A criticism of efficacy research is that because many of the crucial elements of what is actually done during the course of delivering psychotherapy are controlled, the results have good internal validity but limited external validity.

Answer C: Efficacy studies are deemed to have good internal validity but limited external validity.

Answer D: Efficacy studies are deemed to have good internal validity but limited external validity.

Question 32

Correct

Mark 1.00 out of 1.00

Question ID #10917: Studies have shown that psychotherapy research participants in placebo control groups typically show:

Select one:

- ☒ A. greater improvement than those in no-treatment or wait-list control groups. ✓ Correct
- ☐ B. less improvement than those in no-treatment or wait-list control groups.
- ☐ C. similar improvement to those in no-treatment or wait-list control groups.
- ☐ D. no improvement when compared to no-treatment or wait-list control groups.

The correct answer is A.

Studies have shown that placebo conditions have a substantial impact, with participants in placebo control groups typically showing greater improvement in symptoms than those in no-treatment or wait-list control groups. Lipsey and Wilson, for example, report an average effect size of .67 when treated participants are compared to no-treatment controls, but a smaller effect size of .48 when participants in the treatment group are compared to those in a placebo control group (1993).

Answer B: The opposite is true.

Answer C: Greater improvement is typically noted in psychotherapy research placebo control groups.

Answer D: Improvement is typically noted among psychotherapy research placebo control groups.

Question 33

Correct

Mark 1.00 out of 1.00

Question ID #11231: The belief that a child's misbehavior has one of four goals—i.e., attention, revenge, power, or to display inadequacy—is most consistent with:

Select one:

- ☐ A. Beck's cognitive-behavioral therapy.
- ☒ B. Adler's individual psychology. ✓ Correct
- ☐ C. Perls's Gestalt therapy.
- ☐ D. Mahler's object relations theory.

The correct answer is B.

Adler believed that all behaviors are goal-directed and purposeful. He further asserted that while misbehavior was intended to meet one of four goals, each goal ultimately was rooted in a desire to belong.

Answer A: This belief is not most consistent with to Beck's theory.

Answer C: This belief is not most consistent with Perls's theory.

Answer D: This belief is not most consistent with Mahler's theory.

Question 34

Correct

Mark 1.00 out of 1.00

Question ID #11232: Asking the "miracle question" is an initial intervention in which type of therapy?

Select one:

- ☐ A. Transtheoretical
- ☐ B. Interpersonal
- ☐ C. REBT
- ☒ D. Solution-focused ✓ Correct

The correct answer is D.

The "miracle question" is used to help clients identify solutions to their problems. As its name implies, solution-focused therapy focuses on identifying solutions to problems. The miracle question is one of the techniques used by solution-focused therapists to identify solutions and establish therapy goals. It involves asking the client how the client's life would be if their problems were suddenly resolved.

Answer A: The miracle question is not a component of the transtheoretical model.

Answer B: The miracle question is not a component of interpersonal theory.

Answer C: The miracle question is not a component of REBT.

Question 35

Incorrect

Mark 0.00 out of 1.00

Question ID #11233: Solution-focused therapists utilize all of the following interventions except:

Select one:

- ☐ A. the miracle question.
- ☒ B. the exception question. ✗ Incorrect
- ☐ C. reflective questioning.
- ☐ D. scaling questions.

The correct answer is C.

In solution-focused therapy, the therapist acts as a consultant/collaborator who poses different types of questions designed to assist the client in recognizing and using their strengths and resources to achieve specific goals. However, "reflective questioning" is not part of this questioning. This is a made up term.

Answers A, B, and D: Solution-focused therapists utilize all of three of these interventions.

Question 36

Incorrect

Mark 0.00 out of 1.00

Question ID #11234: For a Gestalt therapist, a primary goal of treatment is to help the client:

Select one:

- ☐ A. integrate the present with their past and future.
- ☐ B. integrate the various aspects of the self.
- ☒ C. develop a success identity. ✖ Incorrect
- ☐ D. develop a healthy style of life.

The correct answer is B.

The primary goal of Gestalt therapy is to increase awareness and integration of all aspects of the self. This includes integrating one's feelings, thoughts, and actions.

Answer A: In Gestalt therapy, the focus is on the present. The founder of Gestalt therapy, Fritz Perls, argued that "nothing exists but the now."

Answer C: Developing a success identity is the goal of reality therapy.

Answer D: A focus on developing a healthy life is in alignment with Adlerian therapy.

Question 37

Incorrect

Mark 0.00 out of 1.00

Question ID #11236: Research on Helms's White Racial Identity Development Model suggests that a White therapist will usually be most successful when working with a client from an ethnic/racial minority group when the therapist is in which stage?

Select one:

- ☐ A. Reintegration
- ☒ B. Immersion-emersion ✖ Incorrect
- ☐ C. Autonomy
- ☐ D. Integrative awareness

The correct answer is C.

Helms's White Racial Identity Development Model distinguishes between six identity statuses (stages): contact, disintegration, reintegration, pseudo-independence, immersion-emersion, and autonomy. For the exam, you'll want to be familiar with the characteristics of each stage. A White therapist is likely to be most effective when working with a client from an ethnic/racial minority group when the therapist is in the final stage of Helm's identity development—i.e., the autonomy stage. A person in this stage has internalized a positive (non-racist) White identity that includes an appreciation of and respect for racial/cultural similarities and differences.

Answers A, B, and D: A White therapist is likely to be most effective when working with a client from an ethnic/racial minority group when the therapist is in the final stage of White identity development.

Question 38

Incorrect

Mark 0.00 out of 1.00

Question ID #11240: The primary goal of a newly developed community-based mental health program is to help people recently discharged from a psychiatric hospital adjust to life in the community. This is an example of:

Select one:

- ☐ A. primary prevention.
- ☒ B. secondary prevention. ✗ Incorrect
- ☐ C. tertiary prevention.
- ☐ D. crisis intervention.

The correct answer is C.

Prevention programs are often described as primary, secondary, or tertiary, depending on their goals. You are likely to encounter a question or two on prevention on the exam. Tertiary preventions are designed to reduce the prevalence of mental disorders by reducing the duration or preventing the recurrence of mental disturbance.

Answer A: Primary preventions are designed to prevent the development of a mental disorder.

Answer B: Secondary preventions are designed to reduce the prevalence of mental disorders through early identification and intervention.

Answer D: Crisis interventions are designed to reduce the negative consequences of crises.

Question 39

Correct

Mark 1.00 out of 1.00

Question ID #11241: Culturally sensitive approaches to psychotherapy vary from traditional approaches in that these approaches attempt to understand a client's experience of an illness within the client's cultural context. Thus, culturally sensitive approaches are rooted in an _____ perspective.

Select one:

- ☒ A. emic ✓ Correct
- ☐ B. etic
- ☐ C. emetic
- ☐ D. endogenous

The correct answer is A.

The terms "emic" and "etic" were originally used by linguistic anthropologists but are now also used by psychologists interested in cross-cultural psychotherapy. Culturally sensitive therapies emphasize an emic, or "view from the inside," approach.

Answer B: Traditional psychotherapies reflect an etic, or "view from the outside," approach.

Answer C: The term emetic is a medical term that is not associated with any cultural theory.

Answer D: Endogenous means "originating within."

Question 40

Incorrect

Mark 0.00 out of 1.00

Question ID #11245: Margaret Mahler proposed that the development of a sense of self is related to:

Select one:

- ☐ A. separation-individuation.
- ☒ B. projective identification. ✖ Incorrect
- ☐ C. pseudomutuality.
- ☐ D. assimilation-accommodation.

The correct answer is A.

Mahler's theory of early development focuses on the processes that contribute to the development of a sense of identity. Separation-individuation is triggered by the child's ability to separate from their primary caregiver. It begins at about 4 to 5 months of age when a child who is being held by their caregiver is able to lean away to scan the environment.

Answer B: Melanie Klein used the term "projective identification" to refer to projecting disliked or undesirable aspects of the internal object (self) onto an external object (caregiver).

Answer C: Pseudomutuality describes a relationship between family members that appears to be healthy (is open and mutually empathic) but is not.

Answer D: Assimilation and accommodation are terms used by Piaget to describe the modification and development of cognitive schemas.

Question 41

Incorrect

Mark 0.00 out of 1.00

Question ID #11246: Carl Jung believed that a client's transference:

Select one:

- ☐ A. is a fantasy that distracts the client from reality.
- ☒ B. represents mixed feelings toward the therapist. ✖ Incorrect
- ☐ C. is a form of "acting out."
- ☐ D. reflects the client's personal and collective unconscious.

The correct answer is D.

Jung viewed transference as the projection of both the personal and collective unconscious.

Answer A: Jung did not describe transference as a deviation from reality.

Answer B: Jung did not postulate that transference was rooted in ambiguous feelings toward the clinician.

Answer C: Acting out is a defense mechanism described in psychoanalytic theory.

Question 42

Correct

Mark 1.00 out of 1.00

Question ID #11249: Smith, Glass, and Miller's meta-analysis of the psychotherapy outcome research (1980) found that people receiving therapy are "better off" than about ____ % of people who need treatment but do not receive it.

Select one:

- ☐ A. 45
- ☐ B. 55
- ☒ C. 80 ✓ Correct
- ☐ D. 95

The correct answer is C.

Smith, Glass, and Miller report an average effect size of .85 for 475 controlled studies of psychotherapy (1980). This means that the mean outcome score of people who receive treatment is higher than the mean outcome score of about 80% of people who need treatment but do not receive it. For the exam, you want to be familiar with the results of the Smith et al. meta-analysis as well as understand what meta-analysis is used for and be able to interpret an effect size. These are described in the Clinical Psychology chapter of the written study materials.

Answers A, B, and D: The correct answer is 80%.

Question 43

Correct

Mark 1.00 out of 1.00

Question ID #11252: According to Howard et al.'s phase model (1996), which of the following is most likely to be affected during the first few sessions of psychotherapy?

Select one:

- ☐ A. Coping skills
- ☐ B. Severity of symptoms
- ☐ C. Maladaptive behaviors
- ☒ D. Feelings of hopelessness ✓ Correct

The correct answer is D.

Howard et al.'s (1996) phase model predicts that the effects of therapy vary depending on the number of sessions. The characteristics of the three phases of the model include remoralization, remediation, and rehabilitation. Remoralization occurs during the first few therapy sessions and is characterized by a decline in feelings of hopelessness (K. Howard et al., "Evaluation of psychotherapy: Efficacy, effectiveness, and patient progress," *American Psychologist*, 51, 1059-1064, 1996).

Answer A: The second phase, remediation, involves a focus on strengthening coping skills.

Answer B: Reducing symptom severity is a longer-term goal that typically does not occur within the first few sessions.

Answer C: The final phase, rehabilitation, focuses on unlearning maladaptive behaviors.

Question 44

Incorrect

Mark 0.00 out of 1.00

Question ID #11256: In client-centered case consultation, the consultant's primary goal is to:

Select one:

- ☐ A. help the consultee determine how to work more effectively with a particular client.
- ☐ B. help the consultee identify methods for evaluating their own professional services.
- ☐ C. help a consultee enhance their skills and knowledge so that the consultee functions more effectively in the future.
- ☒ D. work collaboratively with the consultee to jointly deliver an appropriate intervention to a client. ✖ Incorrect

The correct answer is A.

Gerald Caplan (1970) distinguishes between four types of mental health consultation: client-centered case consultation, consultee-centered case consultation, program-centered administrative consultation, and consultee-centered administrative consultation. Client-centered case consultation focuses on a particular client. In this type of consultation, the consultant collects information about the client and makes recommendations to the consultee about the best course of action.

Answer B: This does not accurately describe the primary goal of client-centered case consultation.

Answer C: This describes consultee-centered case consultation.

Answer D: This describes collaboration rather than consultation.

Question 45

Correct

Mark 1.00 out of 1.00

Question ID #11260: In comparing Asian and Asian-American therapy clients to European American clients, researchers frequently point out that the former:

Select one:

- ☐ A. tend to prefer a less directive therapeutic approach.
- ☐ B. are grounded more in the here-and-now than in the past or the future.
- ☐ C. respond better when goal-setting is delayed.
- ☒ D. are more likely to express emotional problems as somatic symptoms. ✓ Correct

The correct answer is D.

It is vitally important that clinicians do not make overgeneralizations about members of any particular group and that they maintain awareness of the literature on cross-cultural psychotherapy, which provides some general conclusions about clients belonging to different ethnic/cultural groups. Researchers have suggested that people from Asian cultures ordinarily view the mind and body as inseparable and, as a result, often express mental health problems as somatic complaints such as headaches, fatigue, or sleep problems.

Answer A: This is the opposite of what researchers have found to be true.

Answer B: Researchers have generally found that individuals from Asian cultures often place importance on the relationship of the past to the present.

Answer C: Researchers suggest that it is usually best to identify goals early in therapy (even during the first session) when working with Asian clients.

Question 46

Correct

Mark 1.00 out of 1.00

Question ID #11262: From the perspective of feminist therapy, therapist self-disclosure is:

Select one:

- ☐ A. contraindicated because it puts the client in a passive role.
- ☐ B. necessary during the early stages of therapy to encourage the client's participation.
- ☐ C. a means of fostering a special bond between the client and the therapist.
- ☒ D. useful for promoting an egalitarian relationship between the therapist and client. ✓ Correct

The correct answer is D.

A key characteristic of feminist therapy is its emphasis on an egalitarian relationship, and sharing one's life experiences with a client is viewed as one way of promoting balance.

Answer A: Promoting client passivity is discouraged in feminist therapy, but appropriate therapist self-disclosure is not considered a contributor to passivity.

Answer B: This describes one use of self-disclosure; however, in feminist therapy, self-disclosure is not described as necessary.

Answer C: Feminist therapists generally discourage developing a "special bond" because doing so can foster the client's dependence on the therapist.

Question 47

Incorrect

Mark 0.00 out of 1.00

Question ID #11265: The first stage in Cross's Black Racial Identity Development Model (2001) is:

Select one:

- ☒ A. conformity. ✗ Incorrect
- ☐ B. incorporation.
- ☐ C. contact.
- ☐ D. pre-encounter.

The correct answer is D.

The most recent version of Cross's Black Racial Identity Development Model distinguishes between four stages: pre-encounter, encounter, immersion-emersion, and internalization. Cross's model is based on the premise that African American identity development is directly linked to racial oppression. During the initial pre-encounter stage, race has low salience.

Answer A: Conformity is the first stage of the Racial/Cultural Identity Development Model.

Answer B: Incorporation is not one of Cross's stages.

Answer C: Contact is the first stage of Helms's White Racial Identity Development Model.

Question 48

Incorrect

Mark 0.00 out of 1.00

Question ID #11272: Replacing a "failure identity" with a "success identity" is a goal of treatment for practitioners of _____ therapy.

Select one:

- ☒ A. Gestalt ✗ Incorrect
- ☐ B. reality
- ☐ C. solution-focused
- ☐ D. Adlerian

The correct answer is B.

Glasser, the founder of reality therapy, viewed identity as a basic psychological need and distinguished between success and failure identities. A person develops a success identity when the person fulfills their needs in a responsible way.

Answer A: This is not a goal of Gestalt therapy.

Answer C: This is not a goal of solution-focused therapy.

Answer D: This is not a goal of Adlerian therapy.

Question 49

Incorrect

Mark 0.00 out of 1.00

Question ID #11274: Prochaska and DiClemente's stages of change (transtheoretical) model (1982) predicts that a person in the _____ stage plans to take action within the next six months that will alter their problematic behavior.

Select one:

- ☐ A. action
- ☐ B. contemplation
- ☒ C. preparation ✗ Incorrect
- ☐ D. precontemplation

The correct answer is B.

The six stages of Prochaska and DiClemente's transtheoretical stages of change model include precontemplation, contemplation, preparation, action, maintenance, and termination. A person in the contemplation stage has not committed to change but intends to take action within the next six months.

Answer A: A person in the action stage is currently taking actions to alter their behavior.

Answer C: A person in the preparation stage is planning to take action in the near future. This is usually defined as in the next month.

Answer D: A person in the precontemplation stage is not planning to change in the foreseeable future.

Question 50

Incorrect

Mark 0.00 out of 1.00

Question ID #11276: People in which of the following stages of Atkinson, Morten, and Sue's (1993) Racial/Cultural Identity Development Model begin to question their rejection of all aspects of the dominant culture and absolute loyalty to their own culture?

Select one:

- ☐ A. Encounter
- ☒ B. Dissonance ✗ Incorrect
- ☐ C. Integrative awareness
- ☐ D. Introspection

The correct answer is D.

The five stages of the Racial/Cultural Identity Development Model include conformity, dissonance, resistance and immersion, introspection, and integrative awareness. During the introspection stage, the individual begins to question the unequivocal position that they adopted during the previous resistance-immersion stage with regard to their own culture and the dominant culture.

Answer A: The encounter stage is the second stage in Cross's Black Racial (Nigrescence) Identity Development Model (1991).

Answer B: During the dissonance stage, the individual begins to question conformity to the dominant culture.

Answer C: During the integrative awareness stage, the person bases acceptance or rejection of aspects of the majority and minority cultures on an objective evaluation.

Question 51

Incorrect

Mark 0.00 out of 1.00

Question ID #11279: A family therapist using the structural approach of Salvador Minuchin would most likely:

Select one:

- ☐ A. clarify boundaries between family members in order to reduce enmeshment.
- ☒ B. work initially with the most differentiated family member. ✗ Incorrect
- ☐ C. use a multiple-therapist team to prevent any one therapist from becoming "triangulated" into the family system.
- ☐ D. issue specific "directives" designed to counteract dysfunctional processes.

The correct answer is A.

As its name implies, structural family therapy focuses on altering the family's structure in order to change the behavior patterns of family members. Even if you are unfamiliar with Minuchin, you may have been able to guess that structural therapy would be concerned with boundaries. Structural family therapists view family dysfunction as being related to boundaries that are too diffuse (enmeshed) or too rigid (disengaged).

Answer B: This is more characteristic of Bowen's approach to family therapy.

Answer C: Minuchin's approach does not involve the use of multiple-therapist teams.

Answer D: The issuance of directives is more characteristic of strategic family therapy than of structural family therapy.

Question 52

Incorrect

Mark 0.00 out of 1.00

Question ID #11282: According to Irvin Yalom, _____ in group therapy is the analogue of the therapist–client relationship in individual therapy.

Select one:

- ☐ A. universality
- ☐ B. identification
- ☐ C. cohesiveness
- ☒ D. alliance ✖ Incorrect

The correct answer is C.

Yalom uses the term cohesiveness to refer to the various relationships that occur in a group. This includes the relationships between group members, between each member and the therapist, and between each member and the group itself. For Yalom, cohesiveness is the primary mode of change in group therapy, with highly cohesive groups having better outcomes. Cohesiveness in group therapy is thus comparable to the quality of the therapeutic alliance in individual therapy.

Answer A: The concept of universality relates to clients' connected pain.

Answer B: Identification is not one of Yalom's 11 therapeutic factors.

Answer D: Alliance is not one of Yalom's 11 therapeutic factors.

Question 53

Correct

Mark 1.00 out of 1.00

Question ID #11284: According to Freud's notion of _____, dreams and slips of the tongue are meaningful goal-directed phenomena.

Select one:

- ☐ A. psychic dynamogenesis
- ☐ B. reciprocal determinism
- ☒ C. psychic determinism ✔ Correct
- ☐ D. ptialism

The correct answer is C.

Freud interpreted dreams, slips of the tongue, etc. as manifestations of unconscious material. According to Freud's doctrine of psychic determinism, behaviors are caused by unconscious phenomena rather than true free will.

Answer A: Dynamogenesis is the principle that motor responses are proportional to sensory activities.

Answer B: Reciprocal determinism proposes that behavior, person, and situation interact and influence each other.

Answer D: Ptyalism refers to the excessive production of saliva, something Pavlov, not Freud, would be interested in.

Question 54

Incorrect

Mark 0.00 out of 1.00

Question ID #11299: The information that family members continuously exchange and that helps minimize deviation and maintain the family's stability is referred to as _____ feedback.

Select one:

- ☐ A. external
- ☐ B. internal
- ☐ C. negative
- ☒ D. positive ✖ Incorrect

The correct answer is C.

In family systems theory, the information exchange between family members can act as either positive or negative feedback. Negative feedback helps the system return to or maintain its steady state. Thus, a "negative feedback loop" helps minimize deviation and thereby maintains the family's stability.

Answer A: This term is not relevant to the question posed.

Answer B: This term is not relevant to the question posed.

Answer D: Positive feedback increases deviation from a steady state and, therefore, produces a change in the family's functioning.

Question 55

Correct

Mark 1.00 out of 1.00

Question ID #13712: According to research when working with a Black family, it is important to keep in mind that:

Select one:

- ☐ A. Black families are predominantly matriarchal.
- ☐ B. Black husbands are usually less tolerant of the career efforts of their wives than White husbands are.
- ☒ C. Black familial roles may be more flexible than White familial roles. ✔ Correct
- ☐ D. Black wives are more willing than White wives to let their husbands make domestic decisions.

The correct answer is C.

Historically, researchers (Billingsley, 1969; Boyd-Franklin, 1989; Paniagua, 1994; Sue & Sue, 2003) have found that Black families are generally less likely to follow traditional White family sex-role stereotypes in comparison to Whites.

Answer A: Researchers have indicated that the power structure of Black families is not substantially different from that found in many White families.

Answer B: This statement is not supported by research regarding Black familial roles.

Answer D: A number of investigators have pointed out that Black and White husbands generally exercise the same degree of decision-making power within the family.

Question 56

Incorrect

Mark 0.00 out of 1.00

Question ID #13980: In the context of structural family therapy, the purpose of "reframing" is to:

Select one:

- ☒ A. diffuse blame. ✗ Incorrect
- ☐ B. relabel behaviors.
- ☐ C. increase specificity.
- ☐ D. anchor behaviors.

The correct answer is B.

Even if you've never heard of "reframing," you probably could have guessed that its purpose is to redefine the situation. Specifically, reframing is done in order to help a client see things from a different perspective. It is often used in a paradoxical way—e.g., telling an adolescent that "your parents' nagging is a sign of their love for you."

Answer A: Reframing will not necessarily lead to diffusion of blame.

Answer C: Increasing specificity is not the goal of reframing.

Answer D: Reframing does involve redefining behaviors, but it does not involve anchoring behaviors.

Question 57

Correct

Mark 1.00 out of 1.00

Question ID #10561: Which of the following statements is an acceptable description of a research participant as per the APA Publication Manual?

Select one:

- ☐ A. Non-white participant
- ☐ B. Physically challenged participant
- ☒ C. Participant diagnosed with borderline personality disorder ✓ Correct
- ☐ D. Participant suffering from multiple sclerosis

The correct answer is C.

This is an acceptable way to describe an individual who has a mental disorder. Ways to reduce bias in language are addressed in the APA's Publication Manual.

Answer A: "Non-white" is improper. The actual race/ethnicity is preferable.

Answer B: "Participant with a disability" would be more appropriate.

Answer D: The word "suffering" is inappropriate. "A person with multiple sclerosis" would be better.

Question 58

Correct

Mark 1.00 out of 1.00

Question ID #11997: A psychologist is most likely to have vicarious liability when acting in which of the following capacities?

Select one:

- ☐ A. Faculty member
- ☒ B. Supervisor ✓ Correct
- ☐ C. Mentor
- ☐ D. Therapist

The correct answer is B.

Vicarious liability (also known as derivative and secondary liability) refers to a person's responsibility for the actions of another person. A psychologist may have vicarious liability when their employee or supervisee engages in illegal behavior.

Answer A: This answer is incorrect, as faculty members, unless they also are serving as clinical supervisors, do not exercise clinical oversight and are less likely to have vicarious liability.

Answer C: Mentors offer support and advice but do not have vicarious liability.

Answer D: Psychologists serving in the role of therapist may be held liable for their actions. However, this question asks about vicarious liability, so this answer choice does not apply.

Question 59

Correct

Mark 1.00 out of 1.00

Question ID #12001: When serving as an evaluator in a child custody case, a psychologist's primary concern should be:

Select one:

- ☐ A. what the child desires.
- ☐ B. maintaining a position of neutrality.
- ☒ C. the best interests of the child. ✓ Correct
- ☐ D. the best interests of the person who hired the psychologist.

The correct answer is C.

The guidelines for child custody evaluations in family law proceedings are summarized in the chapter on ethics and professional issues in the written study materials. The child's best interests (which may or may not be consistent with the child's desires) function as the psychologist's priority concern. The employing party is not relevant given the context of the question.

Answer A: This answer is incorrect, as the child's desires may not be consistent with their best interests.

Answer B: A psychologist should avoid being influenced during an evaluation, but the primary concern is the child's best interests.

Answer D: The psychologist's decision should be based on the child's best interests, not the employing party.

Question 60

Incorrect

Mark 0.00 out of 1.00

Question ID #12002: A practitioner billed her client's insurance company for a completed appointment. The provider did not report that the client cancelled her session with less than 24 hours until the appointment start time. This practice is:

Select one:

- ☐ A. illegal and unethical.
- ☐ B. illegal but ethical.
- ☒ C. legal and ethical. ✖ Incorrect
- ☐ D. legal but unethical.

The correct answer is A.

Standard 6.06 of the APA's Ethics Code demonstrates the correct course of action. It states, "In their reports to payors . . . psychologists take reasonable steps to ensure the accurate reporting of . . . fees, charges, or payments." The practice described in this question is indicative of insurance fraud. Insurance fraud is both illegal and unethical. Always choose the answer that is most consistent with legal and ethical mandates when considering questions pertaining to insurance. Billing an insurance company for missed appointments would be acceptable only if the company agreed to this practice.

Answers B, C, and D: The practice described is both illegal and unethical.

Question 61

Incorrect

Mark 0.00 out of 1.00

Question ID #12007: A former client owes you over \$600.00 in therapy fees and you are considering using a collection agency to collect the money she owes you. As an ethical psychologist, you should:

Select one:

- ☐ A. decide not to do so because using a collection agency is prohibited by the ethical guidelines.
- ☒ B. do so only if you informed the client at the beginning of therapy that you would do so if she did not pay her fees in a ✖ Incorrect timely manner.
- ☐ C. contact the client first to inform her of your intent to use a collection agency if she does not pay her outstanding fees by a specific date.
- ☐ D. use a collection agency only as a last resort.

The correct answer is C.

Standard 6.04 of the APA's Ethics Code explains the correct course of action, stating, "If psychologists intend to use collection agencies or legal measures to collect the fees, psychologists first inform the person that such measures will be taken and provide that person an opportunity to make prompt payment."

Answer A: Using a collection agency is not prohibited by ethical guidelines.

Answer B: Informing the client of your policy at the beginning of therapy is a good idea and may be part of informed consent, but it is not sufficient here.

Answer D: This answer is incorrect as it does not address the ethical obligation in this situation.

Question 62

Correct

Mark 1.00 out of 1.00

Question ID #12009: You have been seeing Leticia Lopez in therapy for several months. Leticia is 24 years old and lives with her widowed mother, who is paying for Leticia's therapy. One day, Leticia's mother calls and says she is very concerned about Leticia and wants to know what she can do to help Leticia feel better about herself. Mrs. Lopez asks that you not tell Leticia that she has called. Your best course of action in this situation would be to:

Select one:

- ☐ A. give Mrs. Lopez the specific advice she has requested.
- ☐ B. tell Mrs. Lopez to ask Leticia what she (Mrs. Lopez) can do to help her.
- ☒ C. tell Mrs. Lopez that it would be best if you discussed this matter with Leticia. ✓ Correct
- ☐ D. suggest that Mrs. Lopez accompany Leticia to her next therapy session.

The correct answer is C.

Leticia is an adult, and even though her mother is paying for her therapy, this does not limit Leticia's confidentiality. This course of action is most consistent with ethical guidelines regarding confidentiality and is also likely to be in the best interests of Leticia from a clinical perspective.

Answer A: Discussing Leticia's status with her mother when Leticia has not given consent violates confidentiality.

Answer B: While not an explicit violation of ethical guidelines, giving advice to the mother about how to interact with Leticia when Leticia has not granted consent is problematic.

Answer D: This would not be an appropriate course of action from either an ethical or clinical perspective.

Question 63

Correct

Mark 1.00 out of 1.00

Question ID #12011: Which of the following best describes APA ethical guidelines regarding sexual intimacy with former therapy clients?

Select one:

- ☐ A. Psychologists are prohibited from having sexual intimacies with former therapy clients under any circumstances.
- ☐ B. Psychologists are prohibited from having sexual intimacies with former therapy clients for at least one year following the termination of therapy.
- ☒ C. Psychologists are prohibited from having sexual intimacies with former therapy clients for two years, and after that time, sexual intimacies would only occur in the most unusual of circumstances. ✓ Correct
- ☐ D. Psychologists are not prohibited from having sexual intimacies with former therapy clients.

The correct answer is C.

The APA's Ethics Code and the Canadian Code of Ethics both discourage psychologists from becoming sexually involved with former therapy clients.

Answer A: This answer is incorrect, because the ethics code allows the possibility of a romantic or sexual relationship two years after therapy has ended, provided the psychologist can demonstrate there has been no exploitation.

Answer B: This answer is incorrect, as two years after termination is the minimal time allowed by the APA Code while Principle II.27 of the Canadian Code of Ethics states that sexual intimacies with former therapy clients must be avoided when "the power relationship reasonably could be expected to influence the client's decision making."

Answer D: Psychologists are strongly discouraged from having sexual intimacies with former clients.

Question 64

Correct

Mark 1.00 out of 1.00

Question ID #12013: In most situations, the "holder of the privilege" is:

Select one:

- ☐ A. the therapist.
- ☒ B. the client. ✓ Correct
- ☐ C. the therapist and client jointly.
- ☐ D. the court.

The correct answer is B.

Privilege is a legal requirement that prohibits, with some exceptions, confidential client information from being disclosed in legal proceedings. The client is ordinarily the holder of the privilege. In most circumstances, only the client can determine when confidential information may be disclosed. Privilege is addressed in the discussion of privacy and confidentiality in the ethics section of the written study materials.

Answers A, C, and D: The client, not the therapist or the court, holds privilege.

Question 65

Correct

Mark 1.00 out of 1.00

Question ID #12017: Dr. Jones, a clinical psychologist, has been seeing Lisa L. in therapy for one month. Dr. Jones considers Lisa to be a very attractive woman and finds himself having sexual fantasies about her. As an ethical psychologist, Dr. Jones should:

Select one:

- ☐ A. recognize that such attraction is normal but proceed with caution.
- ☐ B. confess his attraction to Lisa and make it a topic for mutual examination in therapy.
- ☐ C. recognize that such attraction is inappropriate and refer Lisa to another therapist without explaining the reason to her.
- ☒ D. continue working with Lisa but consult with a colleague if he believes his attraction might be interfering with his objectivity. ✓ Correct

The correct answer is D.

The most professional and ethical behavior in this situation is for Dr. Jones to recognize his feelings while realizing that, as a professional, he cannot act on those feelings. It would be acceptable, under these conditions, for Dr. Jones to continue working with Lisa unless his feelings begin to interfere with his ability to provide treatment to her. If this occurs, Dr. Jones should seek professional consultation to determine the best course of action, and doing so would be consistent with the provisions of Standard 2.06 of the APA's Ethics Code.

Answer A: Attraction to a client is not necessarily "normal," and "proceeding with caution" may not be adequate.

Answer B: Whether therapists should discuss attraction with their clients is a controversial issue and, in most cases, is not advisable.

Answer C: Referring Lisa to another therapist might be the appropriate action if Dr. Jones feels that his attraction to her is interfering with his ability to treat her. The information given in the question, however, does not suggest that this is the case, so Answer D is better.

Question 66

Incorrect

Mark 0.00 out of 1.00

Question ID #12024: The primary function of the psychology licensing board is best described as:

Select one:

- ☐ A. limiting access to the profession.
- ☒ B. providing sanctions for unethical and illegal behavior on the part of psychologists. ✗ Incorrect
- ☐ C. protecting the public welfare.
- ☐ D. accrediting graduate programs in psychology.

The correct answer is C.

Psychology licensing boards protect the public by creating and enforcing regulations designed to ensure that psychologists meet minimal levels of competence.

Answer A: Licensing boards are established to protect the public, not limit access.

Answer B: While boards sanction psychologists for illegal and unethical behavior, this is only one of a number of functions that serve the overall goal of protecting public welfare.

Answer D: Licensing boards do not accredit academic programs.

Question 67

Incorrect

Mark 0.00 out of 1.00

Question ID #12027: Which of the following best describes a true statement based on ethical guidelines for the use of deception in research?

Select one:

- ☐ A. Deception is prohibited in all circumstances.
- ☐ B. Deception is prohibited except when the purpose and design of the study require the use of unobtrusive measures.
- ☐ C. Deception is prohibited whenever it involves deceiving potential participants about aspects of the study that would affect their willingness to participate.
- ☒ D. Deception is acceptable only when participants have given limited consent after being told about the general nature of the study. ✗ Incorrect

The correct answer is C.

According to ethical guidelines, deception can be used in research when it is justified by the study's potential value, when it has been determined that alternative procedures are not available, and when participants are not deceived about aspects of a study that would otherwise influence their willingness to participate. The use of deception in research is addressed in Standard 8.07 of the APA's Ethics Code and Principles III.23, 24, and 27 of the Canadian Code of Ethics and is discussed in the chapter on ethics and professional issues in the written study materials.

Answer A: Deception is allowed when used ethically.

Answer B: Whether researchers use unobtrusive measures is less critical than whether participants can give informed consent.

Answer D: The ethical standards are specific in requiring that participants have sufficient information to consent.

Question 68

Correct

Mark 1.00 out of 1.00

Question ID #12031: Which of the following statements best describes a researcher's obligations regarding the use of animals in psychological research?

Select one:

- ☐ A. Animals should never be used in research when alternative procedures are available.
- ☐ B. Animals should never be used in research if a research procedure will cause them pain or stress.
- ☒ C. Inflicting pain or stress on animals is acceptable in research only when an alternative (nonpainful) procedure is unavailable and the use of the procedure is justified by the potential value of the study. ✓ Correct
- ☐ D. Inflicting pain or stress on animals is acceptable in research as long as it is minimized and the animal's life is terminated as soon as is feasible.

The correct answer is C.

Standard 8.09(e) of the Ethics Code dictates that "psychologists use a procedure subjecting animals to pain, stress, or privation only when an alternative procedure is unavailable and the goal is justified by its prospective scientific, educational, or applied value." Principle II.46 of the Canadian Code of Ethics provides a nearly identical guideline.

Answer A: Ethical guidelines do not prohibit the use of animals in research.

Answer B: This answer is too broad and does not account for situations when animals may be used.

Answer D: This answer fails to account for the scientific and educational value of the research.

Question 69

Correct

Mark 1.00 out of 1.00

Question ID #12033: Dr. Lopez is the only psychologist in a small town, and his son is enrolled in the town's only elementary school. Dr. Lopez receives a call from his son's teacher, who says she would like to begin therapy with Dr. Lopez. As an ethical psychologist, Dr. Lopez should:

Select one:

- ☐ A. tell the teacher that he is ethically prohibited from seeing her because to do so would constitute a multiple (dual) relationship.
- ☒ B. begin therapy with her and discuss the potential for conflicts during the initial session and, if necessary, in subsequent sessions. ✓ Correct
- ☐ C. begin therapy with her but seek consultation if any problems arise.
- ☐ D. begin therapy with her but take special precautions to ensure that client confidentiality is maintained.

The correct answer is B.

Multiple relationships are addressed in Standard 3 of the APA's Ethics Code and in the Ethics Manual. Keep in mind for the licensing exam that the prohibition against multiple relationships is not absolute.

Answer A: Ethical guidelines discourage multiple relationships whenever there is a potential for exploitation or loss of objectivity. The prohibition against multiple relationships is not absolute, however, so if Dr. Lopez is the only psychologist in town, seeing the teacher and discussing the potential for conflict is the best choice. A better course of action might be to see if the teacher can be treated by a therapist in a neighboring town, but this option is not provided by any of the answers.

Answer C: While seeking consultation is usually a sound course of action, this answer fails to address the need to discuss the challenge of multiple relationships with the client.

Answer D: Confidentiality is not the only issue of concern in multiple relationship situations, so this is not the best answer.

Question 70

Incorrect

Mark 0.00 out of 1.00

Question ID #12034: Dr. Harold Hanson, a psychologist who heads the personnel committee at a mental health facility, recommends that a psychologist who has an unresolved charge of sexual harassment against him not be considered for a promotion. In terms of his ethical responsibilities, Dr. Hanson:

Select one:

- ☐ A. has acted ethically, since sexual harassment is explicitly prohibited by the ethical guidelines.
- ☒ B. has acted ethically, as long as he is willing to consider the psychologist for promotion if he is acquitted of the harassment charge. ✗ Incorrect
- ☐ C. has acted ethically, as long as his decision is consistent with the stated promotion policy of the mental health facility.
- ☐ D. has acted unethically by violating the requirements of the ethical guidelines regarding employment procedures.

The correct answer is D.

Standard 1.08 of the APA's Ethic Code prohibits denying a person a promotion "based solely upon their having made or their being the subject of an ethics complaint." Note that this prohibition does not necessarily preclude doing so when a charge against a person has been proven. In the situation described in this question, the charge is unresolved. Although the Canadian Code of Ethics does not explicitly address this situation, Principle I.13 states that psychologists "abide by due process or other natural justice procedures for employment."

Answer A: This answer is incorrect as the charge against the psychologist is still pending.

Answer B: Ethical guidelines do not prescribe actions while a case is unresolved.

Answer C: This answer addresses workplace policy rather than ethical mandates.

Question 71

Correct

Mark 1.00 out of 1.00

Question ID #12035: A graduate student's dissertation chair, Dr. X, turns out to be of little help, and the student ends up obtaining advice and assistance from an associate professor, Dr. Z. Dr. X does review the dissertation when it is completed, and she is listed as the dissertation chair. Several months later, the student decides to write an article for a professional journal that is based on his dissertation research. In terms of publication credit:

Select one:

- ☐ A. Dr. Z should be listed as first author if her contribution was substantial.
- ☒ B. Dr. Z should be listed as second author if her contribution warrants it. ✓ Correct
- ☐ C. Dr. X should be listed as second author since she was the student's official dissertation chair.
- ☐ D. Dr. X and Dr. Z should both be listed as co-authors.

The correct answer is B.

Publication credit is addressed in Standard 8.12 of the APA's Ethics Code and Principle III.7 of the Canadian Code of Ethics. Of the responses given, this one is best because it addresses the need to consider Dr. Z's contribution to the research project (and Dr. X's lack of contribution). Moreover, when a published study is based on a student's dissertation, the student should ordinarily be listed as first author.

Answer A: This is incorrect because the study is based on the student's dissertation.

Answer C: Ethical guidelines emphasize that it is a person's contribution, not their position or status, that determines publication credit.

Answer D: The research is based on the student's dissertation, so the student should be listed as the first author, without a co-author.

Question 72

Correct

Mark 1.00 out of 1.00

Question ID #12045: Dr. Marcos Manzetti uses a "sliding scale" that is based on a client's current income to set his fees for therapy. Dr. Manzetti's practice is:

Select one:

- ☒ A. ethically acceptable since it serves the best interests of his clients. ✓ Correct
- ☐ B. explicitly recommended in the ethical guidelines.
- ☐ C. ethically unacceptable since it treats clients inequitably.
- ☐ D. explicitly prohibited in the ethical guidelines.

The correct answer is A.

Principle D of the APA's General Principles of the Ethics Code emphasizes that "psychologists recognize that fairness and justice entitle all persons to access and benefit from the contributions of psychology." Sliding scale fees enable a client to access services that may otherwise be unavailable.

Answer B: Sliding scale fees are not explicitly addressed in the APA's Ethics Code or the Canadian Code of Ethics.

Answer C: Sliding scale fees for psychological services are consistent with the "spirit" of ethical guidelines as long as they are fair and serve the best interests of the client.

Answer D: Sliding scale fees are not addressed explicitly in the ethics codes; they are implied as a means of benefiting clients who would be unable to access services otherwise.

Question 73

Correct

Mark 1.00 out of 1.00

Question ID #12050: When consulting with a colleague about a "therapeutic impasse" you are having with a therapy client, which statement applies?

Select one:

- ☐ A. It is always necessary to advise the client about the consultation.
- ☐ B. It is necessary to get a signed waiver of confidentiality from the client before discussing any information with the consultant.
- ☐ C. It is unnecessary to advise the client of the consultation as long as only information that is relevant to the impasse is discussed.
- ☒ D. It is unnecessary to advise the client of the consultation as long as the client's identity is not revealed. ✓ Correct

The correct answer is D.

Consultation is addressed in Standard 4.06 of the APA's Ethics Code and Principles I.38 and 45 of the Canadian Code of Ethics. This answer most accurately describes a psychologist's ethical obligation when consulting with a colleague about a therapy client.

Answer A: This answer does not accurately describe ethical requirements related to consultation.

Answer B: Obtaining a waiver of confidentiality is not necessary as long as the client's identity is not revealed.

Answer C: This answer does not accurately describe ethical requirements related to consultation.

Question 74

Correct

Mark 1.00 out of 1.00

Question ID #12051: In terms of ethical guidelines, providing pro bono services is:

Select one:

- ☒ A. recommended. ✓ Correct
- ☐ B. required.
- ☐ C. discouraged.
- ☐ D. prohibited.

The correct answer is A.

Pro bono services are uncompensated professional services that are provided for the public good. While pro bono services are not directly addressed by the APA's Ethics Code or the Canadian Code of Ethics, they are consistent with General Principle A of the Ethics Code, which states that psychologists "strive to contribute a portion of their professional time for little or no compensation or personal advantage."

Answer B: Psychologists are encouraged to provide services for little or no compensation, but they are not required to do so.

Answer C: APA's Ethics Code encourages psychologists to contribute a portion of their services for the public good.

Answer D: Ethical standards encourage psychologists to contribute a portion of their services without compensation.

Question 75

Correct

Mark 1.00 out of 1.00

Question ID #12056: Dr. Isaac Ibraham, a licensed psychologist, wants to expand his private practice. When doing so, he should keep in mind that uninvited in-person solicitations for therapy clients are:

Select one:

- ☐ A. always ethical.
- ☐ B. always unethical.
- ☐ C. unethical only when they provide potential clients with misleading or inaccurate information.
- ☒ D. unethical when the solicited individuals are susceptible to exploitation or undue influence. ✓ Correct

The correct answer is D.

Standard 5.06 of the APA's Ethics Code and Principle III.31 of the Canadian Code of Ethics limit the types of in-person solicitation that are acceptable. Standard 5.06 states that "psychologists do not engage . . . in uninvited in-person solicitation of business [from persons who] . . . are vulnerable to undue influence." Principle III.31 states that psychologists do not exploit others by, for example, "taking advantage of trust or dependency to frighten clients into receiving services," which might occur when in-person solicitations are uninvited.

Answer A: In fact, the ethical guidelines clearly limit what in-person solicitations are acceptable.

Answer B: The ethical guidelines allow for in-person solicitation under certain circumstances.

Answer C: Providing individuals with inaccurate or misleading information would be unethical, but this answer states that solicitation is unethical in this circumstance, which is not the case.

Question 76

Correct

Mark 1.00 out of 1.00

Question ID #12063: A student participant in a research study involving matched pairs decides to withdraw from the study. The chief investigator, who is a licensed psychologist, stresses to the student the importance of this data to the study, but the student insists that his data be withdrawn. The investigator should:

Select one:

- ☐ A. warn the student that withdrawal from the study will affect his course grade.
- ☐ B. remind the student that he signed an informed consent and cannot now request that his data be withdrawn.
- ☐ C. tell the student that his name will be removed from all data and include his data in the study.
- ☒ D. allow the student to withdraw from the study. ✓ Correct

The correct answer is D.

This issue is addressed by Standard 8.02 of the APA's Ethics Code and Principle I.24 of the Canadian Code of Ethics. Standard 8.02(a) states that research participants must be free to "decline to participate and to withdraw from the research once participation has begun," and Principle I.24 similarly states that research participants must have "the option to refuse or withdraw at any time, without prejudice."

Answer A: Warning the student of the negative consequences of withdrawing from the study would be coercive and is a violation of ethical guidelines.

Answer B: This answer is incorrect as it is clearly coercive.

Answer C: This answer is incorrect as the student has withdrawn his consent in stating that he does not want his data included.

Question 77

Incorrect

Mark 0.00 out of 1.00

Question ID #12064: Dr. Pavel Petrovich, a licensed psychologist, has been seeing a client in therapy for over fourteen months with no apparent change in the client's symptoms. Dr. Petrovich should:

Select one:

- ☐ A. advise the client that he is ethically obligated to terminate therapy.
- ☐ B. raise for discussion the possibility of termination and referral to another therapist.
- ☒ C. search the literature for discussions of similar cases that have been treated and reported by others. ✖ Incorrect
- ☐ D. continue seeing the client, since fourteen months is not an unusually long time for therapy to continue without a significant change in symptoms.

The correct answer is B.

Termination of therapy is addressed in Standard 10.10 of the APA's Ethics Code and Principle II.37 of the Canadian Code of Ethics. Standard 10.10(a), for example, states that "psychologists terminate therapy when it becomes reasonably clear that the client/patient no longer needs the service, is not likely to benefit, or is being harmed by continued service," and Standard 10.10(c) states that, prior to termination, psychologists should "suggest alternative service providers as appropriate." The action described in this answer is most consistent with ethical requirements.

Answer A: Without the client's input, the psychologist may not know whether the client finds therapy helpful.

Answer C: This response does not address the ethical responsibility of the psychologist to explore termination and referral as an option.

Answer D: This answer is incorrect, because in most cases, fourteen months is sufficiently long to consider the possibility of termination when a client has shown "no apparent change" in symptoms.

Question 78

Incorrect

Mark 0.00 out of 1.00

Question ID #12067: The Buckley Amendment establishes:

Select one:

- ☐ A. the right of parents or legal guardians of a child to inspect the child's school records.
- ☐ B. the right of patients to have access to their own hospital records.
- ☐ C. the requirement for employers to make reasonable modifications to tests for applicants with disabilities.
- ☒ D. the requirement for schools to provide a free appropriate public education to students with disabilities. ✖ Incorrect

The correct answer is A.

The Buckley Amendment, also known as the Family Education Rights and Privacy Act (FERPA), is described in the Ethics Manual. The Buckley Amendment states that any school district may be denied federal funds if parents or other legal guardians of students, or students who have reached the age of maturity, are not given access to the students' school records.

Answer B: Medical records are subject to the Health Insurance Portability and Accountability Act, or HIPAA.

Answer C: People with disabilities are protected by the Americans with Disabilities Act or the ADA.

Answer D: Public Law 94-142, not the Buckley Amendment, guarantees free appropriate education to children with disabilities.

Question 79

Incorrect

Mark 0.00 out of 1.00

Question ID #12072: Dr. Carl Carlson is a licensed psychologist and professor in the psychology department at a large university. He is approached by a graduate student, Marla M., age 36, who asks him if he'd like to attend a baseball game on Friday night. Dr. Carlson is divorced and finds Marla to be a very attractive woman. In terms of ethical guidelines, if Dr. Carlson accepts Marla's invitation, he will be:

Select one:

- ☐ A. clearly violating ethical guidelines.
- ☐ B. acting ethically since he is not the one who initiated a potential relationship.
- ☐ C. acting ethically as long as Marla is a student in a department other than the psychology department and will not be taking any classes in the psychology department.
- ☒ D. acting ethically as long as he does not become sexually involved with Marla until she is no longer affiliated with the university. ✗ Incorrect

The correct answer is C.

Dating students is ordinarily prohibited or discouraged, because doing so represents a multiple relationship. If Marla is a graduate student in another department, a relationship with her would not represent a multiple relationship, because Dr. Carlson is not likely to be her instructor or advisor.

Answer A: Dr. Carlson may or may not be violating ethical guidelines, depending on the circumstances.

Answer B: The fact that Marla initiated the potential relationship is not relevant.

Answer D: As long as Dr. Carlson does not have "supervisory, evaluative, or other authority" over Marla, it would not be a violation of ethical guidelines if he becomes sexually involved with her (see Standards 3.08 and 7.07 of the APA's Ethics Code and Principle II.28 of the Canadian Code of Ethics). Personal relationships with students might be prohibited by university policy, but this question is asking about ethical guidelines.

Question 80

Correct

Mark 1.00 out of 1.00

Question ID #12076: A couple brings their ten-year-old son to therapy at the suggestion of his school counselor, who is concerned because the boy has started arguing with his teacher and getting into physical fights with his classmates. After several sessions with the boy and his family, you receive a letter from the school principal requesting information about the boy's condition, and a signed release from the boy's parents is included with the letter. As an ethical psychologist, you should:

Select one:

- ☐ A. refuse to release the records to anyone but a licensed psychologist.
- ☐ B. refuse to release the records to anyone but the boy's parents.
- ☒ C. release only that information you believe to be relevant to the school's concerns. ✓ Correct
- ☐ D. release photocopies of your complete file on the boy and his family.

The correct answer is C.

Since the boy's parents have signed a release, you would ordinarily provide information to the school principal, but not necessarily all of the information available. The most ethical course of action in this situation would be to release only information that is relevant to the school's role in the boy's treatment. Doing so would be consistent with the provisions of Standard 4.04(a) of the APA's Ethics Code, which states that written and oral reports include "only information germane to the purpose for which the communication is made." It is also consistent with the provisions of Principles 1.37 and 39 of the Canadian Code of Ethics.

Answer A: It is not always practical or necessary to limit communication to another psychologist. In this case, the parents seem to believe the psychologist has helpful information to offer school personnel.

Answer B: In signing the release, the parents are consenting to a degree of communication between the identified parties.

Answer D: The psychologist is ethically bound to release the information relevant to the concerns of school personnel.

Question 81

Incorrect

Mark 0.00 out of 1.00

Question ID #12082: Students in an introductory psychology class are required to participate in one of the university's ongoing research projects. This practice is:

Select one:

- ☐ A. ethical as long as students can choose to participate in an alternative activity instead.
- ☐ B. ethical as long as students are free to choose the research project they participate in.
- ☒ C. ethical as long as informed consent is obtained from students before they participate. ✖ Incorrect
- ☐ D. clearly unethical.

The correct answer is A.

This issue is addressed by Standard 8.04 of the APA's Ethics Code and Principle I.36 of the Canadian Code of Ethics. Standard 8.04(b), for example, states that "when research participation is a course requirement or an opportunity for extra credit, the prospective participant is given the choice of equitable alternative activities."

Answer B: This is incorrect, as the ethical guidelines state that students need to have the option of an alternative assignment if they do not want to serve as a research participant.

Answer C: Even though informed consent is required for research participants, this answer does not address the ethical concern involved in requiring students to participate.

Answer D: Having the option to participate in research can be a learning opportunity for students, provided that they are not required to do so when there are no other options.

Question 82

Correct

Mark 1.00 out of 1.00

Question ID #12083: The 1976 Tarasoff decision established:

Select one:

- ☐ A. the right of a parent to inspect and request modifications to their child's school records.
- ☒ B. a psychologist's duty to protect the intended victim of a therapy client. ✓ Correct
- ☐ C. the 80% rule as a standard for determining the fairness of a selection test or other employment procedure.
- ☐ D. a psychologist's duty to report suspected or known cases of child abuse.

The correct answer is B.

The Tarasoff decision established that, under certain circumstances, client confidentiality must be breached when the client is a danger to others. Although the original 1974 Tarasoff decision established a "duty to warn" the intended victim of a therapy client, that decision was superseded by the 1976 rehearing of the case, which established a "duty to protect" the intended victim. Specifically, the 1976 ruling states that a psychotherapist has a duty to protect an intended victim of a therapy client by warning "the intended victim or others likely to apprise the victim of the danger, . . . [notifying] the police, or . . . [taking] whatever other steps are reasonably necessary under the circumstances." Additional information on the ruling is provided in the Ethics Manual.

Answer A: The Buckley Amendment deals with parental rights to inspect and revise school records.

Answer C: The Tarasoff decision deals with a client who is a danger to another.

Answer D: The Tarasoff decision is not restricted to child abuse.

Question 83

Correct

Mark 1.00 out of 1.00

Question ID #12823: When a psychologist learns that a colleague has committed an ethical violation, the psychologist:

Select one:

- ☐ A. may choose to ignore the violation if it is unlikely to be repeated by the colleague.
- ☐ B. must report the violation to the Ethics Committee or state/provincial licensing board.
- ☒ C. may attempt to resolve the situation informally by discussing it with the colleague if it seems appropriate to do so. ✓ Correct
- ☐ D. should contact the colleague's client to ascertain that a violation has actually occurred before taking any further action.

The correct answer is C.

Ethical guidelines require psychologists to take action when they learn that a colleague has committed an ethical violation. This may involve addressing the issue informally when it seems appropriate to do so or reporting the violation to the Ethics Committee or licensing board when it does not seem appropriate for, or has not been resolved adequately through, informal resolution. This issue is addressed in Standards 1.04 and 1.05 of the APA's Ethics Code and Principles II.41 and II.42 of the Canadian Code of Ethics.

Answer A: The ethical guidelines do not recommend ignoring unethical behavior in a colleague.

Answer B: This is incorrect as it states a psychologist **MUST** report the violation to the Ethics Committee or licensing board, which is not true, especially if it can be resolved informally.

Answer D: Ethical guidelines do not recommend involving clients in investigating unethical behavior.

Question 84

Correct

Mark 1.00 out of 1.00

Question ID #13233: The Ethics Committee is investigating a complaint against a psychologist and requests, by letter, that you provide the Committee with information about the complainant. The complainant is a former client of yours that you stopped seeing 9 years ago. As an ethical psychologist, you should:

Select one:

- ☐ A. respond immediately to the Committee's request by supplying the relevant information.
- ☐ B. respond immediately to the Committee's request, but only provide information you believe is relevant to the complaint.
- ☐ C. respond to the Committee's request by advising that the information you have is obsolete.
- ☒ D. respond immediately to the Committee's request but only provide information after verifying that the former client has signed a release of information. ✓ Correct

The correct answer is D.

Standard 1.06 of APA's Ethics Code states that psychologists address issues related to confidentiality and that they respond to inquiries from Ethics Committees. This answer is consistent with the provisions of the ethical guidelines.

Answer A: To send information without a release of information would violate confidentiality in this case.

Answer B: Providing information without a release would violate confidentiality.

Answer C: If the information in the file is obsolete, it would be important to note this in any response to the Ethics Committee. However, this response fails to address the issue of confidentiality.

Question 85

Correct

Mark 1.00 out of 1.00

Question ID #13548: The owner of a small advertising agency refers an employee of the agency to Dr. K., a clinical psychologist, for an evaluation. The owner states that he believes the employee is "too thick-headed" to be a benefit to the company. The owner and Dr. K. agree, prior to the evaluation, that the psychologist will report back to the owner and advise if additional training may improve the employee's job performance. The psychologist prepares a report for the owner after several sessions. The owner consequently decides to terminate the employee based on this report and the employee's previous work history. The employee is very upset with Dr. K. for not informing him about the purpose of the evaluation and proceeds to file a complaint against Dr. K. with the Ethics Committee. The Committee is likely to:

Select one:

- ☐ A. dismiss the complaint since complaints can be filed only by the clients of psychologists (in this case, the owner) or by other psychologists.
- ☐ B. dismiss the complaint since, in this situation, the psychologist could not reveal the purpose of the evaluation to the employee in order to obtain accurate information.
- ☐ C. dismiss the complaint since the psychologist acted appropriately by providing information only to his client, the owner, who was responsible for informing the employee about the purpose of the evaluation.
- ☒ D. find that the psychologist acted unethically by not informing the employee about the purpose of the evaluation. ✓ Correct

The correct answer is D.

Ethical Standard 3.07 states that "when psychologists agree to provide services to a person or entity at the request of a third party, psychologists attempt to clarify at the outset of the service the nature of the relationship with all individuals or organizations involved. This clarification includes the role of the psychologist (e.g., therapist, consultant, diagnostician, or expert witness), an identification of who is the client, the probable uses of the services provided or the information obtained, and the fact that there may be limits to confidentiality." The Ethics Committee censured a psychologist for not clearly explaining the purpose of the evaluation to the employee in an actual case that was similar to this scenario (APA, 1987).

Answer A: There is no restriction regarding who can file a complaint against a psychologist (except that complaints generally cannot be filed anonymously).

Answer B: This is not consistent with the provisions of the Ethics Code, given that the psychologist did not explain at the outset the probable uses of the information obtained.

Answer C: This is not consistent with the provisions of the Ethics Code, given that the psychologist did not clarify at the outset the nature of relationships with all parties and the probable uses of the information obtained.

Question 86

Incorrect

Mark 0.00 out of 1.00

Question ID #10213: Research on job satisfaction suggests that it:

Select one:

- ☐ A. is an enduring disposition that is minimally affected by job changes.
- ☐ B. is unrelated to being treated equitably by one's employer.
- ☐ C. is a poor predictor of longevity.
- ☒ D. has a positive correlation with turnover. ✖ Incorrect

The correct answer is A.

Research suggests job satisfaction is a stable trait that is minimally affected by changes in occupations and/or employers. This has been supported by twin studies that indicate a genetic contribution to job satisfaction.

Answer B: Job satisfaction is related to employees' perception of being treated equitably by their employer. Research suggests that equitable treatment is more predictive of job satisfaction than is the actual level of pay.

Answer C: Research demonstrates that job satisfaction is a better predictor of longevity than either physical health or tobacco use.

Answer D: There is a negative correlation between job satisfaction and turnover ($r = -.40$), meaning that as measures of job satisfaction increase, turnover rates decrease.

Question 87

Correct

Mark 1.00 out of 1.00

Question ID #11349: A group's performance on a(n) _____ task is limited by the performance of the least skilled or knowledgeable member of the group.

Select one:

- ☐ A. additive
- ☐ B. compensatory
- ☐ C. disjunctive
- ☒ D. conjunctive ✔ Correct

The correct answer is D.

Group tasks are categorized as additive, compensatory, disjunctive, or conjunctive. On a conjunctive task, the performance of the least competent member places a limit on the group's product or performance. Mountain climbing is an example of a conjunctive task.

Answer A: On additive tasks, the coordinated efforts of several people add together to form the group product.

Answer B: When performing a compensatory task, the average of the contributions of all members of the group represents the group product.

Answer C: On a disjunctive task, the solution of one member of the group is chosen by the group to be the group's solution.

Question 88

Correct

Mark 1.00 out of 1.00

Question ID #11351: Expectancy theory predicts that worker motivation depends on several factors including "valence", which refers to:

Select one:

- ☒ A. the employee's beliefs about the value of rewards provided for successful performance. ✓ Correct
- ☐ B. the employee's beliefs about the inherent (intrinsic) value of the work itself.
- ☐ C. the strength of the worker's motivation and organizational commitment.
- ☐ D. the strength of the effort (versus ability) component of the worker's motivation.

The correct answer is A.

According to expectancy theory, motivation is a function of three components: expectancy, instrumentality, and valence. For the exam, you want to be familiar with the characteristics of all three components. Valence refers to the value a worker places on the outcomes that will be provided for successful performance. When these outcomes have positive valence, this increases the worker's motivation to perform.

Answer B: Expectancy theory does not address the employee's beliefs about the inherent (intrinsic) value of the work itself.

Answer C: Expectancy theory does not address the strength of the worker's motivation and organizational commitment.

Answer D: Expectancy theory does not address the strength of the effort (versus ability) component of the worker's motivation.

Question 89

Incorrect

Mark 0.00 out of 1.00

Question ID #11353: According to Fiedler's contingency model of leadership, high LPC (least preferred coworker) leaders:

Select one:

- ☐ A. are always more effective than low LPC leaders.
- ☐ B. are more effective than low LPC leaders in moderately favorable situations.
- ☐ C. elicit less trust from supervisees than do low LPC leaders.
- ☒ D. elicit less intrinsic motivation from supervisees than do low LPC leaders. ✗ Incorrect

The correct answer is B.

According to Fiedler, low LPC leaders are most effective in low and high favorable situations, while high LPC leaders are most effective in moderately favorable situations.

Answer A: Fiedler's model of leadership is a contingency theory that proposes that leadership effectiveness is the result of an interaction between the leader's style and the favorableness of the situation and will therefore vary according to this contingency, with high LPC leaders being more effective in some situations and low LPC leaders being more effective in others.

Answer C: High LPC leaders are relationship-oriented and are concerned with maintaining supportive and trusting relationships with their supervisees, but nothing in this theory assumes that the supervisees themselves reciprocate this trust.

Answer D: Fiedler studied leadership effectiveness, not the intrinsic motivation of employees, but implied that the ability of high and low LPC leaders to foster the motivation of employees depends on the interaction between the leader's style and the nature of the situation.

Question 90

Incorrect

Mark 0.00 out of 1.00

Question ID #11355: An organizational psychologist finds that his newly developed selection test has different validity coefficients for male and female applicants and that the difference is statistically significant. This suggests that the test has:

Select one:

- ☐ A. incremental validity.
- ☒ B. discriminant validity. ✗ Incorrect
- ☐ C. differential validity.
- ☐ D. convergent validity.

The correct answer is C.

For the exam, you should be familiar with all of the terms listed in the answers to this question. Additional information about these terms is provided in the Industrial-Organizational Psychology chapter of the written study materials. The selection test described in this question has different levels of validity for males and females—i.e., it has differential validity.

Answer A: A test's incremental validity refers to the benefits that use of the test provides with regard to decision-making accuracy.

Answer B: A test has discriminant (divergent) validity when it has low correlations with tests that measure different traits, characteristics, or abilities. Discriminant validity provides evidence of a test's construct validity.

Answer D: A test has convergent validity when it correlates highly with tests that measure the same trait. Convergent validity provides evidence of construct validity.

Question 91

Incorrect

Mark 0.00 out of 1.00

Question ID #11356: In organizations, the 80% rule is used to determine if:

Select one:

- ☐ A. a selection procedure is having an adverse impact.
- ☐ B. a selection procedure is cost effective.
- ☐ C. a performance appraisal measure has adequate relevance.
- ☒ D. a performance appraisal measure has adequate utility. ✗ Incorrect

The correct answer is A.

The 80% rule is described in the EEOC's Uniform Guidelines on Employee Selection Procedures and is used to determine if a selection test or other employment procedure is discriminating against members of a group protected by law. As defined by the 80% rule, a selection test is having an adverse impact when the proportion of minority-group applicants who are selected is less than 80% of the proportion of majority-group applicants who are selected.

Answer B: Cost effectiveness is irrelevant with regard to the 80% rule.

Answer C: Adequate relevance of a performance appraisal is not the defining attribute of the 80% rule.

Answer D: Adequate utility of a performance appraisal is not the defining attribute of the 80% rule.

Question 92

Incorrect

Mark 0.00 out of 1.00

Question ID #11364: Lewin's force field theory describes planned change in organizations as involving which of the following stages?

Select one:

- ☐ A. Unfreezing, changing, and refreezing
- ☒ B. Forming, performing, and re-forming ✗ Incorrect
- ☐ C. Identifying, planning, and acting
- ☐ D. Setting the stage, problem-solving, and reaching an agreement

The correct answer is A.

According to Lewin (1951), organizations continuously respond to forces that either promote or resist change. Unfreezing, changing, and refreezing are the three stages of planned change identified by Lewin.

Answer B: These are not the three stages of planned change identified by Lewin.

Answer C: These are not the three stages of planned change identified by Lewin.

Answer D: These are the three stages of mediation.

Question 93

Incorrect

Mark 0.00 out of 1.00

Question ID #11365: The primary purpose of a realistic job preview is to:

Select one:

- ☐ A. increase the number of applicants for a job.
- ☒ B. develop an accurate job description. ✖ Incorrect
- ☐ C. reduce on-the-job conflicts between managers and employees.
- ☐ D. reduce employee dissatisfaction and turnover.

The correct answer is D.

Realistic job previews may consist of job descriptions, videos, discussions with current employees, work samples, and/or other procedures or techniques. One assumption underlying the use of realistic job previews is that turnover is related to unrealistic expectations about the job. Instead, providing applicants with accurate information about what the job entails will help to reduce unrealistic expectations and thereby decrease dissatisfaction and turnover.

Answer A: A realistic job preview may actually decrease, not increase, the number of applicants for a job.

Answer B: It is not the purpose of a realistic job preview to develop an accurate job description.

Answer C: The purpose of a realistic job preview is to reduce unrealistic job expectations, not on-the-job conflicts between managers and employees.

Question 94

Incorrect

Mark 0.00 out of 1.00

Question ID #11368: Donald Super's _____ graphically depicts the correspondence between an individual's life roles and life stages.

Select one:

- ☐ A. life career rainbow
- ☒ B. life staircase ✖ Incorrect
- ☐ C. mandala
- ☐ D. octagon

The correct answer is A.

Super uses several pictures to illustrate elements of his life-space, life-span theory of career development. The life career rainbow relates the individual's nine life roles (e.g., child, student, citizen) to five life stages (growth, exploration, establishment, maintenance, and disengagement).

Answer B: Super does not use a life staircase to depict components of his theory.

Answer C: Super does not use a mandala to depict his theory.

Answer D: Super does not use an octagon to illustrate elements of his theory (but Holland uses a hexagon to illustrate elements of his theory).

Question 95

Correct

Mark 1.00 out of 1.00

Question ID #11374: A transformational leader uses "framing" in order to:

Select one:

- ☒ A. make the organization's goals more meaningful to employees. ✓ Correct
- ☐ B. clarify the consequences of undesirable performance.
- ☐ C. reduce personal biases in decision-making.
- ☐ D. adapt their leadership style to the characteristics of subordinates.

The correct answer is A.

Even if you're unfamiliar with the term "framing," you may have been able to identify the correct answer with your knowledge of transformational leadership. Transformational leaders recognize the need for change and are able to communicate that need to employees. Framing is one technique these leaders use to inspire employees, and it involves describing the organization's goals in a way that makes them more meaningful to employees.

Answer B: A transformational leader does not use framing to clarify the consequences of undesirable performance.

Answer C: The term "framing" is also used to refer to a type of decision-making bias. In that context, framing occurs when the description of a problem in a positive or negative way influences the type of decision that is made. However, this question is asking about the use of framing by transformational leaders.

Answer D: This response, if it included the leader utilizing a style that would not only adapt to the characteristics of the employee but to the work environment as well, would be describing the Path-Goal Theory, not the transformational leader's use of framing.

Question 96

Incorrect

Mark 0.00 out of 1.00

Question ID #11379: The best conclusion that can be drawn about the four-day (compressed) workweek is that it has:

Select one:

- ☐ A. long-lasting positive effects on attitudes and productivity.
- ☐ B. long-lasting negative effects on attitudes and productivity.
- ☐ C. positive effects on attitudes but little or no impact on productivity.
- ☒ D. positive effects on attitudes initially but, over time, increasingly negative effects on both attitudes and productivity. ✖ Incorrect

The correct answer is C.

The compressed workweek requires employees to work a 4-day, 40-hour week. Overall, alternative work schedules have been found to have more beneficial effects on attitudes than on productivity, and this seems to be particularly true for the compressed workweek. For example, a meta-analysis of the research on the compressed workweek by Baltes and his colleagues (1999) found an effect size of .59 for satisfaction and .04 for productivity.

Answer A: The four-day (compressed) workweek does not have specific long-lasting effects of any kind.

Answer B: The four-day (compressed) workweek does not have specific long-lasting effects of any kind.

Answer D: The four-day (compressed) workweek does not have effects that change over time.

Question 97

Correct

Mark 1.00 out of 1.00

Question ID #11381: According to Hersey and Blanchard's situational leadership model, "employee maturity" is a function of the employee's:

Select one:

- ☐ A. stage of career development.
- ☐ B. personality.
- ☒ C. skills and willingness to assume responsibility. ✔ Correct
- ☐ D. beliefs about the meaning and value of work.

The correct answer is C.

Hersey and Blanchard propose that a leader is most effective when their behavior matches the employee's level of maturity. Hersey and Blanchard distinguish between two aspects of employee maturity: job maturity refers to the employee's knowledge and skills, while psychological maturity refers to the employee's self-confidence and willingness to assume responsibility.

Answers A, B, and D: "Employee maturity" in this theory is considered a function of the employee's skills and willingness to assume responsibility, not a function of the stage of career development, personality, or beliefs about the meaning and value of work.

Question 98

Correct

Mark 1.00 out of 1.00

Question ID #11384: Assessment centers are most commonly used to:

Select one:

- ☐ A. hire and promote clerical workers.
- ☒ B. hire and promote managers. ✓ Correct
- ☐ C. train semi-skilled and skilled workers.
- ☐ D. train salespeople.

The correct answer is B.

Assessment centers were originally used during World War II as a means of selecting OSS agents. They are now used primarily for evaluating and predicting the performance of managerial-level employees—particularly, evaluating managerial-level employees for the purpose of selection, promotion, or training. Assessment centers have participants engage in a variety of exercises, many of which simulate the actual tasks a manager performs on-the-job.

Answer A: Assessment centers are most commonly used to hire and promote managers, not clerical workers.

Answer C: Assessment centers are most commonly used to hire and promote managers, not to train semi-skilled and skilled workers.

Answer D: Assessment centers are most commonly used to hire and promote managers, not to train salespeople.

Question 99

Correct

Mark 1.00 out of 1.00

Question ID #11393: In organizations, the "paired comparison" technique is used to:

Select one:

- ☒ A. evaluate an employee's job performance. ✓ Correct
- ☐ B. make hiring and placement decisions.
- ☐ C. identify an employee's training needs.
- ☐ D. determine the appropriate compensation for a job.

The correct answer is A.

The paired comparison technique is a method of performance appraisal. See the Industrial-Organizational Psychology chapter for a description of other specific methods that you're likely to encounter on the exam. As its name implies, use of the paired comparison technique involves comparing each employee to every other employee in pairs on each dimension of job performance.

Answers B, C, and D: In organizations, the "paired comparison" technique is used to evaluate an employee's job performance, not make hiring and placement decisions, identifying an employee's training needs, or determining the appropriate compensation for a job.

Question 100

Correct

Mark 1.00 out of 1.00

Question ID #11399: The rational-economic model of decision making is based on the assumption that:

Select one:

- ☐ A. decision makers place more emphasis on the costs of certain decisions than on other consequences of their decisions.
- ☒ B. decision makers have complete information about all alternatives and their consequences before making decisions. ✓ Correct
- ☐ C. individuals are better than groups at making decisions, especially under stressful conditions.
- ☐ D. decision makers' knowledge about possible alternatives is always incomplete.

The correct answer is B.

As its name implies, the rational-economic model assumes that decisions are based on a rational process. From the perspective of the rational-economic model, "rational" means considering all alternatives and their consequences before making a decision.

Answer A: Decision makers' placement of more emphasis on the costs of certain decisions than on other consequences of their decisions is not an assumption of the rational-economic model.

Answer C: The fact that individuals are better than groups at making decisions, especially under stressful conditions, is not an assumption of this model.

Answer D: A criticism of the rational-economic model is that it does not take into account that a decision maker's knowledge about alternatives is often incomplete.

Question 101

Correct

Mark 1.00 out of 1.00

Question ID #11401: The primary purpose of a(n) _____ is to obtain detailed information about job requirements in order to facilitate decisions related to compensation.

Select one:

- ☐ A. needs assessment
- ☐ B. organizational analysis
- ☐ C. job analysis
- ☒ D. job evaluation ✓ Correct

The correct answer is D.

Of the procedures listed in the answers, only one is conducted specifically to facilitate decisions related to compensation. A job evaluation is conducted specifically for the purpose of determining the relative worth of jobs in order to set wages and salaries. It does this by identifying compensable factors such as skills and education, autonomy and responsibility, and the consequences of errors.

Answer A: A needs assessment is conducted to identify training needs.

Answer B: An organizational analysis is often part of a needs assessment and is conducted to identify the organization's goals.

Answer C: A job analysis is conducted to identify the essential characteristics of a job. Job analysis serves several functions in an organization and may be the first step in a job evaluation.

Question 102

Correct

Mark 1.00 out of 1.00

Question ID #11411: An organizational psychologist would most likely recommend the use of vestibule training for which of the following jobs?

Select one:

- ☒ A. Airline pilot ✓ Correct
- ☐ B. Word processor
- ☐ C. Salesperson
- ☐ D. Clinical psychologist

The correct answer is A.

Vestibule training involves the use of a simulated job environment. Vestibule training is used when on-the-job training would be too costly or hazardous, as it would be in pilot training.

Answer B: Vestibule training would be inappropriate for training a word processor since on-the-job training would not be too costly or hazardous for such a position.

Answer C: Vestibule training would be inappropriate for training a salesperson since on-the-job training would not be too costly or hazardous for such a position.

Answer D: Vestibule training would be inappropriate for training a clinical psychologist since on-the-job training would not be too costly or hazardous for such a position.

Question 103

Correct

Mark 1.00 out of 1.00

Question ID #11413: If you were hired by a large company to develop a new training program, your first step would probably be to conduct a:

Select one:

- ☒ A. needs analysis. ✓ Correct
- ☐ B. job evaluation.
- ☐ C. summative evaluation.
- ☐ D. formative evaluation.

The correct answer is A.

For the exam, you want to be able to distinguish among needs analysis, job analysis, and job evaluation. All three are described in the Industrial-Organizational Psychology chapter of the written study materials. Training program development begins with a needs analysis (also known as a needs assessment), which usually consists of three components: an organizational analysis, a job analysis, and a person analysis.

Answer B: A job evaluation is conducted to determine the appropriate compensation for a job.

Answer C: A summative evaluation is conducted to determine the effects of a training program or intervention after it has been developed.

Answer D: A formative evaluation is conducted while a training program or intervention is being developed to determine if modifications are required in order for the program or intervention to achieve its goals.

Question 104

Correct

Mark 1.00 out of 1.00

Question ID #11422: A manager who adheres to the principles of "scientific management" would most likely agree with which of the following?

Select one:

- ☐ A. Employees view work as natural as play and actively seek autonomy and responsibility.
- ☐ B. An employee's relationships with their coworkers are important determinants of job satisfaction.
- ☒ C. Because employees value money more than other incentives, pay is the most effective motivator. ✓ Correct
- ☐ D. An employee's unfulfilled needs take precedence over other needs, and rewards should be determined accordingly.

The correct answer is C.

Scientific management was developed by Frederick Taylor (1911) who applied the scientific method to the study of job productivity. Taylor believed that employees are motivated primarily by economic self-interest and, therefore, that money is the most effective motivator.

Answer A: This describes McGregor's Theory Y managers.

Answer B: This is an assumption of the human relations movement, which was an alternative to scientific management.

Answer D: This seems more akin to Maslow's need hierarchy theory.

Question 105

Correct

Mark 1.00 out of 1.00

Question ID #11429: In the context of Holland's RIASEC model, _____ refers to the difference in the magnitude of scores an examinee obtains on the six personality types.

Select one:

- ☐ A. consistency
- ☒ B. differentiation ✓ Correct
- ☐ C. identity
- ☐ D. congruence

The correct answer is B.

All of the terms listed in the answers to this question refer to constructs that are important in Holland's theory. The question provides an accurate description of differentiation. A highly differentiated person obtains a high score on one personality type and low scores on all other types.

Answer A: In Holland's model, consistency refers to the similarity of the individual's primary interests (highest codes). For example, realistic and enterprising are consistent, but realistic and social are not consistent.

Answer C: Vocational identity refers to the degree to which the individual has a clear and stable picture of his or her goals, interests, and talents.

Answer D: Congruence refers to the degree of similarity between the person and the person's work environment.

Question 106

Correct

Mark 1.00 out of 1.00

Question ID #11619: The highest levels of learning and performance are usually associated with:

Select one:

- ☐ A. low levels of arousal.
- ☒ B. moderate levels of arousal. ✓ Correct
- ☐ C. high levels of arousal.
- ☐ D. variability in levels of arousal.

The correct answer is B.

Even if you're not familiar with the Yerkes-Dodson law (which proposes that learning and performance are curvilinearly related to arousal), you may have been able to identify the correct answer on the basis of common sense—i.e., most people perform best when their level of arousal is somewhere between "none" and "a lot." Moderate levels of arousal are associated with the highest levels of learning and performance. This is particularly true when moderate levels of arousal are combined with moderate task difficulty.

Answer A: A low level of arousal can lead to boredom, which can negatively affect learning and performance.

Answer C: A high level of arousal can lead to stress and fatigue, which can negatively affect learning and performance.

Answer D: Varying levels of arousal would not be optimal for learning and performance.

Question 107

Incorrect

Mark 0.00 out of 1.00

Question ID #13129: What is the best way to mitigate the halo effect?

Select one:

- ☐ A. Train the raters
- ☒ B. Use peer ratings ✖ Incorrect
- ☐ C. Make the results of all assessments available to employees
- ☐ D. Involve raters in the rating scale development process

The correct answer is A.

Employee performance assessments frequently involve subjective measures that are associated with rater bias. One bias type is the halo effect. The halo effect occurs when the rater's rating of an employee's job performance on one dimension affects performance ratings on other dimensions. Rating scale training increases rating accuracy. Researchers have demonstrated that comprehensive training can mitigate the halo effect. The halo effect and other rater bias types can also be reduced by employing multiple raters, by implementing behavior-specific ratings (as opposed to ratings based on global behaviors), and by using specific scale types (such as forced-choice and paired comparison scales).

Answer B: Peer ratings have been identified as reliable predictors of training success but have not proven effective for mitigating the halo effect.

Answer C: Result availability enhances employee acceptance of the appraisal process but does not help to mitigate the halo effect.

Answer D: This does not represent a direct method of mitigating the halo effect. However, rater involvement in the overall rating process can potentially increase accurate and thorough rating scale use.

Question 108

Incorrect

Mark 0.00 out of 1.00

Question ID #13949: Which of the following would be LEAST useful for eliminating the halo effect, the central tendency bias, and other rater biases from performance ratings?

Select one:

- ☐ A. Paired comparison
- ☐ B. Likert scale
- ☒ C. Forced distribution ✗ Incorrect
- ☐ D. Ranking

The correct answer is B.

This question relies on the distinction between relative and absolute measures of employee performance. Absolute techniques used to measure job performance are susceptible to a number of rater biases that limit their accuracies, such as the leniency/strictness bias, the central tendency bias, and the halo effect (which can be positive or negative). The Likert scale is a subjective rating scale that is susceptible to rater bias and may not provide accurate information pertaining to performance ratings. Likert-type scales and other graphic rating scales are susceptible to rater bias, particularly when global dimensions are rated. The other answer options are examples of relative measures of employee performance, where raters are required to compare two or more employees to each other. Relative techniques help alleviate rater biases.

Answer A: The paired comparison technique is used when a rater compares each employee with every other employee, in pairs, on dimensions of job performance.

Answer C: The forced distribution technique involves assigning employees to a limited number of categories based on predefined normal distribution on one or more dimensions of job performance.

Answer D: Ranking employees is another relative technique used to mitigate rater bias. Employees may be ranked from highest to lowest on a dimension of job performance (such as most to least productive).

Question 109

Correct

Mark 1.00 out of 1.00

Question ID #13950: An employer can refuse to hire older workers:

Select one:

- ☐ A. only when there is a much larger proportion of younger than older job applicants.
- ☐ B. when previous experience with an older worker has suggested that they cannot perform the job successfully.
- ☐ C. when the employer hires older workers for other positions in the company.
- ☒ D. when younger age is required due to the nature of the job. ✓ Correct

The correct answer is D.

Title VII and related legislation includes anti-discrimination exception requirements for instances wherein discrimination may be necessary for the normal operation of the business. Age discrimination is acceptable if age is clearly a bona fide occupational qualification (BFOQ). Disneyland HR personnel would likely not encounter EEOC resistance for employing only younger men for the position of "Prince Charming."

Answer A: This is not an acceptable reason for not hiring older workers.

Answer B: One or a few "bad experiences" would not be sufficient justification for not hiring older workers.

Answer C: This is not considered an adequate remedy by anti-discrimination legislation.

Question 110

Incorrect

Mark 0.00 out of 1.00

Question ID #10227: Which of the following do implosive therapy and flooding have in common?

Select one:

- ☒ A. Both involve exposure to an unconditioned (aversive) stimulus. ✗ Incorrect
- ☐ B. Both are based on counterconditioning.
- ☐ C. Both involve the use of negative reinforcement.
- ☐ D. Both lead to extinction of the undesirable response.

The correct answer is D.

Implosive therapy and flooding are both behavioral treatments that are premised on the principles of classical conditioning. The conditioned response is eventually extinguished through exposure to the feared stimulus, either in vivo (as in flooding) or in imagination (as in implosive therapy).

Answer A: This answer is incorrect because the exposure is to the conditioned—not the unconditioned—stimulus in both treatments.

Answer B: Neither implosive therapy nor flooding involves counterconditioning, which is a technique that is utilized in systematic desensitization through use of relaxation techniques when anxiety-provoking stimuli are presented.

Answer C: Negative reinforcement is an operant conditioning term. This response is incorrect because both treatments are derived from classical, not operant, conditioning.

Question 111

Incorrect

Mark 0.00 out of 1.00

Question ID #10481: Bandura's social cognitive theory predicts that:

Select one:

- ☐ A. cognitive events act as intervening variables in the acquisition of a new behavior.
- ☐ B. social approval is a powerful primary reinforcement.
- ☒ C. reinforcement has a greater impact on learning than on performance. ✖ Incorrect
- ☐ D. the acquisition of new behaviors is the result of internalized S-R connections.

The correct answer is A.

According to social learning theory, which was later reworked to be social cognitive theory; an individual learns a new behavior simply by observing another person engaging in that behavior. Bandura concluded that observational learning involves four processes, which are critical intervening variables in the acquisition of a new behavior: attention, retention, reproduction, and motivation. Attention (i.e., attending to and accurately perceiving the behavior) and retention (i.e., symbolic processing of the modeled behavior) are cognitive processes. Therefore, Answer A is correct.

Answer B: Although Bandura acknowledges that social approval may have a reinforcing effect on a behavior, observation of new behavior is the primary focus of social learning theory.

Answer C: This is the opposite of what is true. Bandura proposed that reinforcement is more important for performance than learning.

Answer D: Exploring internalized S-R connections is not a part of Bandura's social learning theory. The focus of social learning theory is on the four intervening variables between stimuli and response that are identified above.

Question 112

Incorrect

Mark 0.00 out of 1.00

Question ID #11600: According to Albert Ellis, maladaptive behavior is caused primarily by which of the following?

Select one:

- ☒ A. Learned helplessness ✗ Incorrect
- ☐ B. Boundary disturbances
- ☐ C. A lack of response-contingent reinforcement
- ☐ D. Irrational thoughts and beliefs

The correct answer is D.

The basic premise of Ellis's rational-emotive behavior therapy (REBT) is that maladaptive behaviors and emotions are the result of irrational thoughts and beliefs. Thus, the primary goal of REBT is to replace the client's irrational thoughts and beliefs with more rational, adaptive ones, which will ultimately reduce the occurrence of maladaptive behavior. Knowing that Ellis's approach is classified as a type of cognitive-behavioral therapy would have helped you identify the correct response to this question.

Answer A: Learned helplessness, discovered by Martin Seligman and Steven F. Maier, is the phenomenon that occurs when an individual is consistently exposed to an aversive experience outside of their control and ultimately stops trying to change their circumstances, even when opportunities to do so are presented.

Answer B: In gestalt therapy, the term "boundary disturbance" is used to describe an individual's difficulty with differentiating one's self from their environment. Good boundaries are viewed as critical for health and survival. Confluence occurs when the separation between self and others is unidentifiable, and isolation occurs when the boundary between self and others is impermeable.

Answer C: Response-contingent reinforcement is a principle outlined in behavior therapy used to conceptualize the development of depression: when the degree of positive reinforcement experienced in response to healthy behaviors decreases, decreased behavioral activation and increased depressive symptoms occur.

Question 113

Incorrect

Mark 0.00 out of 1.00

Question ID #11601: Elmo, age 5, has learned that if he has a tantrum at mealtime whenever his parents want him to eat food he doesn't like, his parents will let him eat something else instead so that he will stop crying. In this situation, the parents' behavior (letting Elmo eat something other than the disliked food) is being maintained by which of the following?

Select one:

- ☐ A. Escape conditioning
- ☒ B. Avoidance conditioning ✖ Incorrect
- ☐ C. Stimulus discrimination
- ☐ D. Stimulus generalization

The correct answer is A.

Escape conditioning is a type of negative reinforcement (i.e., operant conditioning) that occurs when a person's behavior is maintained because it allows the person to escape an undesirable stimulus. In this situation, the parents' choice to let Elmo eat something other than the disliked food is negatively reinforced because it results in termination of his tantrum.

Answer B: Avoidance conditioning is another type of negative reinforcement that occurs when a cue signals that the undesirable stimulus is about to begin. In this case, the undesirable stimulus can be avoided entirely if the individual performs the appropriate (i.e., reinforced) behavior in response to the cue.

Answer C: Stimulus discrimination, a classical conditioning concept, occurs when a conditioned response occurs only in response to a specific conditioned stimulus and not in response to other stimuli.

Answer D: In stimulus generalization (also a concept in classical conditioning), the individual responds with a conditioned response to stimuli that are similar to the original conditioned stimulus.

Question 114

Correct

Mark 1.00 out of 1.00

Question ID #11603: In Pavlov's research with animals, he found that dogs began to salivate in response to a tone after the tone had been presented repeatedly with meat powder. In this situation, the tone was:

Select one:

- ☒ A. a conditioned stimulus. ✓ Correct
- ☐ B. an unconditioned stimulus.
- ☐ C. a primary reinforcer.
- ☐ D. a secondary reinforcer.

The correct answer is A.

In classical conditioning, an unconditioned stimulus (US) naturally elicits an unconditioned response (UR). A conditioned stimulus (CS) elicits a conditioned response (CR) after it has been repeatedly paired with an unconditioned stimulus (US). In Pavlov's studies, the tone was a conditioned stimulus (CS) because it elicited salivation (the CR) only as the result of being paired with the meat powder (the US) that naturally elicited salivation (the UR).

Answer B: The unconditioned stimulus (US) elicits a response without any learning trials (i.e., pairing with other stimuli). In this situation, the US is the meat powder.

Answer C: In operant conditioning, primary reinforcers are reinforcers that are inherently reinforcing, such as food or water.

Answer D: In operant conditioning, secondary reinforcers are reinforcers that have been conditioned to be reinforcing as a result of being paired with primary reinforcers. For example, tokens in a token economy, money, or grades in school are secondary reinforcers because they are associated with primary reinforcers (e.g., can be used to buy food, result in the experience of pleasure).

Question 115

Incorrect

Mark 0.00 out of 1.00

Question ID #11611: Samuel, age 43, says, "Even though I've just been given a bonus at work, I feel like I'm about to be fired." As defined by Aaron Beck, Samuel is exhibiting which of the following cognitive distortions?

Select one:

- ☐ A. Musturbatory thinking
- ☒ B. Polarized thinking ✖ Incorrect
- ☐ C. Personalization
- ☐ D. Arbitrary inference

The correct answer is D.

As defined by Beck, "arbitrary inference" involves drawing a conclusion that is made in the absence of supporting evidence or in the presence of contradictory evidence. That definition fits this situation.

Answer A: "Musturbatory thinking" is a term used by Ellis that refers to a belief that certain conditions must be met in order for an individual to be happy—for example "I must be liked by everyone, and if not, I'm a terrible person."

Answer B: "Polarized," or dichotomous, thinking involves seeing things as either black or white, with few to no shades of gray, consistent with the "all-or-none" principle.

Answer C: "Personalization" involves mistakenly viewing oneself as the cause of a negative event even if it was entirely out of one's control.

Question 116

Incorrect

Mark 0.00 out of 1.00

Question ID #11626: Research on the serial position effect provides support for the distinction between:

Select one:

- ☐ A. iconic and echoic memory.
- ☐ B. distributed and parallel processing.
- ☐ C. short- and long-term memory.
- ☒ D. proactive and retroactive interference. ✖ Incorrect

The correct answer is C.

The "serial position effect" refers to the tendency to recall items at the beginning and end of a list better than items in the middle of the list, especially when recall occurs immediately after rehearsing the list. One explanation for the serial position effect is that items in the beginning of the list have been stored in long-term memory, while those in the end of the list are still present in short-term memory.

Answer A: Iconic (visual) and echoic (auditory) memory are both types of sensory memory, a brief memory that allows sensory information to be retained long enough for it to be recognized prior to transfer of important details into short-term memory.

Answer B: Parallel processing is the brain's ability to take in and process multiple sources of information at once. For example, when one sees a stop sign, they do not first see the shape, then the color, then the words; instead, they process them all simultaneously. Distributed processing postulates multiple memory systems into which information is processed in a step-by-step manner (e.g., sensory, then short-term, then long-term).

Answer D: Proactive interference is when previously learned information or older memories interfere with learning new information or retrieving newer memories (e.g., difficulty learning or recalling a friend's phone number after having previously learned the old number). Retroactive interference is when new information interferes with one's ability to recall older memories or previously learned information (e.g., a piano player learns to play a new song and then has difficulty recalling how to play an old song).

Question 117

Incorrect

Mark 0.00 out of 1.00

Question ID #11629: When using the Premack principle to modify a behavior, the reinforcer is:

Select one:

- ☐ A. applied intermittently.
- ☐ B. a generalized conditioned reinforcer.
- ☐ C. a behavior that occurs frequently.
- ☒ D. a stimulus that naturally elicits the desired behavior. ✖ Incorrect

The correct answer is C.

The Premack principle is a type of positive reinforcement in which a high-frequency behavior is used as the reinforcer to increase the frequency of a low-frequency, less desired behavior. It is also known as "Grandma's Rule" (e.g., "you can go out and play [a highly desired behavior] once you've cleaned your room [a less desired behavior]").

Answer A: The reinforcer (i.e., the high-frequency, desirable behavior) must be applied consistently.

Answer B: The reinforcer is a naturally reinforcing behavior, not conditioned.

Answer D: The reinforcer only elicits the desired behavior because it is contingent upon the desired behavior being performed (e.g., a student studies for an hour because only then are they permitted to play video games).

Question 118

Incorrect

Mark 0.00 out of 1.00

Question ID #11634: A behavior therapist working with a child who bites her nails sets a timer so that it rings every 5 minutes. The child is then given a reward for every 5-minute period that she doesn't bite her nails. The therapist is using which of the following techniques?

Select one:

- ☐ A. Differential reinforcement
- ☒ B. Response cost ✗ Incorrect
- ☐ C. Overcorrection
- ☐ D. Premack principle

The correct answer is A.

The child is being reinforced for every 5-minute period during which she engages in behaviors other than biting her nails. Differential reinforcement is when non-target behaviors are reinforced but the target behavior is not.

Answer B: Response cost is a punishment procedure that involves withdrawing a conditioned reinforcer following occurrence of a target behavior to decrease the target behavior.

Answer C: Overcorrection is used to reduce undesirable behaviors. It involves having the individual engage in repetition of appropriate behaviors in response to occurrence of the undesirable behavior (i.e., returning the environment to its previous condition).

Answer D: When using the Premack principle, a high-frequency behavior is used as a reinforcer for a low-frequency behavior to increase the occurrence of the low-frequency behavior.

Question 119

Correct

Mark 1.00 out of 1.00

Question ID #11635: John Watson found that after Little Albert had been classically conditioned to respond with fear to a white rat, the child also responded with fear to other white furry objects. Little Albert's reaction to other white furry objects was the result of:

Select one:

- ☐ A. higher-order conditioning.
- ☐ B. negative transfer.
- ☐ C. pseudoconditioning.
- ☒ D. stimulus generalization. ✓ Correct

The correct answer is D.

Stimulus generalization occurs when an individual responds with a conditioned response to stimuli that are similar to the original conditioned stimulus. Little Albert's response (fear) to a specific conditioned stimulus (the white rat) generalized to similar stimuli (other white furry objects).

Answer A: Higher-order conditioning is a classical conditioning technique in which a neutral stimulus elicits a conditioned response as a result of its pairing with a conditioned stimulus. In Little Albert's situation, other white furry objects were not "paired with" the white rat.

Answer B: Negative transfer occurs when previous learning interferes with new learning.

Answer C: Pseudoconditioning occurs when a conditioned response occurs following repeated exposure to the unconditioned stimulus only (i.e., when the neutral stimulus is not paired with the unconditioned stimulus but its presentation elicits a response similar to the conditioned response). For example, Wickens & Wickens (1940) found that a mild shock (US) and a buzzer (NS) both elicited the response of foot withdrawal after early training had involved presenting the mild shock repeatedly on its own without pairing with the buzzer.

Question 120

Correct

Mark 1.00 out of 1.00

Question ID #11640: Dismantling studies have found evidence that which of the following principles is attributable to the effectiveness of systematic desensitization as a treatment for anxiety?

Select one:

- ☐ A. Escape conditioning
- ☒ B. Extinction ✓ Correct
- ☐ C. Satiation
- ☐ D. Higher-order conditioning

The correct answer is B.

Systematic desensitization was developed as an application of reciprocal inhibition (counterconditioning). However, research using the dismantling strategy suggests that reciprocal inhibition is not the essential component. Instead, the results of this research has led researchers to conclude that repeated exposure to feared stimuli leads to the extinction of the undesirable anxiety response and is responsible for the benefits of systematic desensitization. (For a description of the dismantling strategy, see the Learning Theory chapter of the written study materials.)

Answer A: Escape conditioning is a form of aversive conditioning in which a subject responds to the presentation of an aversive/unpleasant stimulus by engaging in a behavior to escape that stimulus and the alternative behavior is thus reinforced. It does not allow for continued exposure to the anxiety trigger as is necessary in systematic desensitization.

Answer C: Satiation is an operant conditioning term. It occurs when the frequency of a reinforced behavior decreases despite the continued presence of the reinforcer due to continued contact with the reinforcer to the point of excess and subsequent reduction of the effectiveness of the reinforcer.

Answer D: Higher-order conditioning is a classical conditioning technique in which a neutral stimulus elicits a conditioned response as a result of its pairing with a conditioned stimulus and is not related to systematic desensitization.

Question 121

Incorrect

Mark 0.00 out of 1.00

Question ID #11645: The technique known as "stress inoculation training" consists of three overlapping phases. These are:

Select one:

- ☐ A. preparation, action, and reflection.
- ☒ B. engagement/motivation, behavior change, and generalization. ✗ Incorrect
- ☐ C. initiation of treatment, primary treatment/rehabilitation, and aftercare.
- ☐ D. conceptualization/education, skill acquisition and rehearsal, and application and follow through.

The correct answer is D.

Stress inoculation training (Meichenbaum & Jaremko, 1982) was designed to help people deal with stressful events by increasing their coping skills. It is a cognitive-behavioral technique that consists of the three phases listed in this response.

Answer A: These phases are common in reflective practices.

Answer B: These components are 3 of the 5 major components of functional family therapy.

Answer C: These are common components of many methods for treating substance use and addiction.

Question 122

Incorrect

Mark 0.00 out of 1.00

Question ID #11646: When using a continuous schedule of reinforcement to increase the occurrence of a desirable behavior, you would be most concerned about which of the following?

Select one:

- ☐ A. Satiation
- ☐ B. Sensitization
- ☐ C. Experimental neurosis
- ☒ D. Spontaneous recovery ✗ Incorrect

The correct answer is A.

A continuous schedule of reinforcement involves reinforcing the individual every time they emit the target response. Satiation occurs when a reinforcer loses its reinforcing value because the organism has become satisfied (satiated). It is a potential problem when using positive reinforcement, especially when the reinforcer is a primary reinforcer and is delivered on a continuous schedule.

Answer B: In the context of learning theory, sensitization has at least two meanings: it refers to either the initial increase in responsiveness to a stimulus when it is presented repeatedly or to the increase in responsiveness to a stimulus that occurs after exposure to a very intense or irritating stimulus.

Answer C: Experimental neurosis occurs in classical conditioning when the organism is required to discriminate between very similar stimuli.

Answer D: Spontaneous recovery refers to the return of a conditioned response following the apparent extinction of that response.

Question 123

Incorrect

Mark 0.00 out of 1.00

Question ID #11652: Which of the following best describes elaborative rehearsal?

Select one:

- ☐ A. Making new information meaningful
- ☒ B. Consciously repeating new information ✖ Incorrect
- ☐ C. Practicing a new skill past the point of mastery
- ☐ D. Thinking aloud while studying

The correct answer is A.

Researchers interested in memory distinguish between two types of rehearsal: elaborative and maintenance. Elaborative rehearsal involves making new information meaningful in order to enhance its retention and retrieval. Relating new information to previously acquired information is one type of elaborative rehearsal.

Answer B: This sounds more like maintenance rehearsal, which involves the rote repetition of information.

Answer C: This response describes "overlearning."

Answer D: This response describes the "thinking aloud method," not elaborative rehearsal.

Question 124

Incorrect

Mark 0.00 out of 1.00

Question ID #11654: The "law of effect" was proposed by:

Select one:

- ☐ A. Tolman.
- ☐ B. Thorndike.
- ☒ C. Watson. ✖ Incorrect
- ☐ D. Bandura.

The correct answer is B.

According to the law of effect, a response that is followed by a "satisfying state of affairs" is more likely to be repeated. Thorndike's experiments with cats in puzzle boxes established a connection between the consequences of a behavior and the likelihood that the behavior will be repeated, and he referred to this connection as the "law of effect."

Answer A: Tolman is associated with cognitive maps and research with rats that led to his identification of "latent learning."

Answer C: Watson used Pavlovian (classical) conditioning to explain the development of fear responses.

Answer D: Bandura is most associated with social (observational) learning theory.

Question 125

Incorrect

Mark 0.00 out of 1.00

Question ID #11664: Children living in a residential facility are rewarded with a specific number of tokens each time they perform desirable behaviors but must return a certain number of tokens when they engage in undesirable behaviors. The latter technique (returning tokens) exemplifies which of the following?

Select one:

- ☒ A. Negative reinforcement ✗ Incorrect
- ☐ B. Response cost
- ☐ C. Premack principle
- ☐ D. Differential reinforcement

The correct answer is B.

This question is asking which technique involves removing a stimulus following a behavior in order to reduce or eliminate that behavior. Response cost is used to eliminate an undesirable behavior and involves imposing a penalty or fine (i.e., removing a specific stimulus) whenever the undesirable behavior occurs. Response cost is an application of negative punishment. Note that, for the exam, you want to be familiar with all four techniques listed in the answers to this question. These techniques are described in greater detail in the Learning Theory chapter of the written study materials.

Answer A: Negative reinforcement involves removing a stimulus following a behavior, but its goal is to increase the behavior, not to decrease it.

Answer C: The Premack principle involves using a high-frequency behavior as a reinforcer for a low-frequency behavior in order to increase the low-frequency behavior.

Answer D: Differential reinforcement is used to decrease an undesirable behavior by reinforcing alternative behaviors. It does not involve removing a specific stimulus (e.g., tokens) following the undesirable behavior, which is what is occurring in the situation described in this question.

Question 126

Correct

Mark 1.00 out of 1.00

Question ID #11665: The process of gradually removing a prompt until it is no longer provided is referred to as:

Select one:

- ☐ A. extinction.
- ☐ B. shaping.
- ☒ C. fading. ✓ Correct
- ☐ D. thinning.

The correct answer is C.

The process of gradually eliminating prompts is referred to as "fading."

Answer A: Extinction refers to the removal of an unconditioned stimulus and presenting the conditioned stimulus alone (classical conditioning) or to removing a reinforcer that has been maintaining a behavior (operant conditioning).

Answer B: Shaping involves reinforcing successive approximations of the desired behavior (i.e., any behavior leading to the development of the target behavior is rewarded).

Answer D: Thinning is the process of gradually reducing the frequency of reinforcement (i.e., switching from a continuous to an intermittent schedule of reinforcement).

Question 127

Correct

Mark 1.00 out of 1.00

Question ID #11670: Findings from studies comparing participants' ability to recall a list of words they had memorized based on whether or not they were allowed to sleep following memorization provide support for which of the following theories?

Select one:

- ☐ A. Trace decay theory
- ☒ B. Interference theory ✓ Correct
- ☐ C. Motivated forgetting theory
- ☐ D. Retrieval failure theory

The correct answer is B.

Interference theory proposes that accurate memory recall is impaired due to interference from other, similar memories. The research referred to in this question found that participants who slept remembered more than those who stayed awake. The results of this research suggest that forgetting is not due simply to the passage of time but, instead, to the events that follow learning. In other words, memory loss is due to the interference of other events.

Answer A: Trace decay theory predicts that forgetting is due to the passage of time. If this theory were correct, participants who did not sleep would have exhibited similar levels of recall compared to those who did sleep.

Answer C: Freud proposed that motivated forgetting is due to the repression of unconscious desires.

Answer D: Retrieval failure theory predicts that memory loss is due to an inability to retrieve information from long-term memory, as opposed to failure to store information.

Question 128

Correct

Mark 1.00 out of 1.00

Question ID #13057: _____ used chimpanzees as his research subjects in studies designed to investigate the role of cognition in learning.

Select one:

- ☐ A. Tolman
- ☐ B. Ebbinghaus
- ☐ C. Thorndike
- ☒ D. Kohler ✓ Correct

The correct answer is D.

All of the individuals listed in the answer options conducted studies on learning. However, Kohler was the only one to use chimpanzees as his research subjects. Kohler's work with chimpanzees led to his description of insight learning.

Answer A: Tolman's research with rats led to his identification of "latent learning."

Answer B: Ebbinghaus acted as his own subject in research on forgetting.

Answer C: Thorndike's experiments with cats in puzzle boxes led to the formulation of the "law of effect."

Question 129

Incorrect

Mark 0.00 out of 1.00

Question ID #13551: A friend describes what the hot fudge sundae you are eating reminds him of in the most disgusting terms he can call to mind just as you begin to eat. He does this several times until you can no longer continue eating the sundae because it makes you feel sick. This situation has the closest resemblance to which of the following techniques?

Select one:

- ☒ A. Operant shaping ✗ Incorrect
- ☐ B. Prompting and fading
- ☐ C. Paradoxical intention
- ☐ D. Covert sensitization

The correct answer is D.

This situation is most like covert sensitization, a type of aversive counterconditioning in which an undesirable behavior is paired with an unpleasant image. The goal of covert sensitization is to change the desirable response that occurs in response to a conditioned stimulus (CS) to an undesirable response in order to eliminate a behavior. As the result of pairing an imagined aversive scene with a sundae, eating a sundae has become unpleasant, and subsequently, "sundae-eating behavior" will be avoided or eliminated. The imagined aversive scene is the unconditioned stimulus (US), the sundae is the conditioned stimulus (CS), and the resulting avoidance behavior is both the unconditioned and conditioned response (UR/CR).

Answer A: This situation is not similar to operant shaping, which uses reinforcement of successive approximations of a desired behavior to increase or establish that behavior.

Answer B: This situation is not similar to prompting and fading. Prompting (e.g., giving verbal instructions, giving physical guidance, or using nonverbal cues) is used to facilitate the acquisition of a new behavior. Fading is the gradual removal of prompts.

Answer C: This situation is not similar to paradoxical intention, which involves imagining an exaggerated version of conditions surrounding a fear in order to eliminate the fear.

Question 130

Incorrect

Mark 0.00 out of 1.00

Question ID #13787: The phenomenon known as "blocking" will occur in which of the following circumstances?

Select one:

- ☐ A. The CS is presented prior to the US until a CR is established; then the CS and a new neutral stimulus are presented together several times prior to the US.
- ☒ B. The CS is presented prior to the US until a CR is established; then the CS is presented several times with a new neutral ✗ Incorrect stimulus until the CR is extinguished.
- ☐ C. The CS is presented prior to the US until a CR is established; then a new neutral stimulus is presented prior to the CS.
- ☐ D. The CS is presented prior to the US until a CR is established; then a new neutral stimulus is presented after the CS.

The correct answer is A.

Blocking occurs when a conditioned stimulus (CS) blocks a second neutral stimulus from becoming a CS. The first step to blocking is establishing an association between the CS and the unconditioned stimulus (US). Then, a new neutral stimulus is presented in conjunction with the CS prior to presenting the US. When this sequence is followed, the new neutral stimulus provides redundant information because the occurrence of the US was fully predicted by the already-conditioned response (the CS) alone. Consequently, the neutral stimulus does not become associated with the US and does not produce a conditioned response (CR). This is the process described in Answer A.

Answer B: The CR does not occur in response to the neutral stimulus when presented alone, but it does continue to occur in response to the original CS. Therefore, the CR is not extinguished.

Answer C: In blocking, the CS and the new neutral stimulus are presented at the same time, prior to the US.

Answer D: The new neutral stimulus must be presented together with the CS and prior to the US.

Question 131

Correct

Mark 1.00 out of 1.00

Question ID #10001: Children experiencing peer rejection versus children subject to peer neglect experience which trajectory when changing schools?

Select one:

- ☒ A. School change has no effect on the status of rejected children but may have beneficial effects on the peer status of neglected children. ✓ Correct
- ☐ B. School change has no effect on the peer status of neglected children but may have beneficial effects on the peer status of rejected children.
- ☐ C. School change is likely to have no effect on the peer status of either rejected or neglected children.
- ☐ D. School change is likely to have beneficial effects on the peer status of both rejected and neglected children.

The correct answer is A.

Coie and Kupersmidt showed that peer rejection tends to be stable across social transitions and is maintained in novel social groups, while those that are peer neglected may improve relations in the new setting (Coie, John D., and Kupersmidt, Janis B, "A Behavioral Analysis of Emerging Social Status in Boys' Groups," *Child Development*, 1983, 54, 1400-1416).

Answer B: As noted above, Coie and Kupersmidt's data show that those who have experienced peer rejection do not typically improve social relations in new settings, in contrast to students who have been peer neglected.

Answer C: As noted above, Coie and Kupersmidt's findings do show a difference in the social transitions between peer rejected and peer neglected students.

Answer D: As noted above, the beneficial effect shown by Coie and Kupersmidt is only observed in peer neglected students.

Question 132

Incorrect

Mark 0.00 out of 1.00

Question ID #10647: Aging causes what change in the focal point of the eye?

Select one:

- ☐ A. The near focal point will move away from the eyes.
- ☐ B. The near focal point will move closer to our eyes.
- ☒ C. The near focal point will remain the same, but the distant focal point will move away from our eyes. ✗ Incorrect
- ☐ D. The near focal point will remain the same, but the distant focal point will move closer to our eyes.

The correct answer is A.

The process of accommodation, defined by the near and far focal point, is changed by the hardening of the visual lens with age. The near focal point moves farther away.

Answer B: In aging, the near focal point moves farther away.

Answer C: In aging, the near focal point moves farther away with no change in the distant focal point.

Answer D: In aging, the near focal point moves farther away while the distant focal point remains the same.

Question 133

Incorrect

Mark 0.00 out of 1.00

Question ID #11164: Current theories consider "emotional contagion" to be the earliest manifestation of empathy development. This behavior emerges:

Select one:

- ☐ A. in the first weeks of life.
- ☒ B. between two and four months of age. ✗ Incorrect
- ☐ C. at about six months of age.
- ☐ D. at about one year of age.

The correct answer is A.

Emotional contagion refers to the tendency of babies to cry at the sound of another infant's cries. This occurs in infants as young as two days old and is considered by experts to be the first sign of empathy.

Answers B, C, and D: Emotional contagion occurs in the earliest days of infancy.

Question 134

Correct

Mark 1.00 out of 1.00

Question ID #11454: The intellectual disability associated with PKU is preventable with:

Select one:

- ☐ A. removal of environmental toxins.
- ☐ B. blood transfusions.
- ☒ C. a special diet. ✓ Correct
- ☐ D. antibiotics.

The correct answer is C.

PKU (phenylketonuria) involves an inability to metabolize the amino acid phenylalanine. Intellectual disability and other symptoms of PKU can be reduced or eliminated by a diet low in phenylalanine beginning at birth.

Answer A: PKU is a recessive gene disorder that is not related to environmental toxins.

Answer B: PKU is not addressed with blood transfusions.

Answer D: Antibiotics are not used with PKU, as it is not due to infection.

Question 135

Incorrect

Mark 0.00 out of 1.00

Question ID #11455: Independent, self-confident adolescents, according to Baumrind and colleagues (1991), are most likely to have parents who are:

Select one:

- ☐ A. authoritative.
- ☒ B. authoritarian. ✖ Incorrect
- ☐ C. permissive.
- ☐ D. traditional.

The correct answer is A.

Baumrind and her colleagues distinguish between authoritarian, authoritative, permissive, and rejecting-neglecting parents. The authoritative style is most likely to produce independent, self-confident children and adolescents. Authoritative parents combine rational control with warmth, receptivity, and the encouragement of independence. It's very likely that you'll encounter a question on these styles on the exam, so be familiar with their characteristics and effects, which are described in the written study materials.

Answer B: Authoritarian parents impose absolute standards of control and stress obedience, and they are willing to use force to obtain compliance. Their children tend to be insecure, anxious, and dependent and display a limited sense of responsibility.

Answer C: Permissive parents provide their children with few controls or demands and display moderate levels of warmth. Their children exhibit little self-reliance, exploratory behavior, or self-control.

Answer D: "Traditional" is not a parenting style identified by Baumrind.

Question 136

Incorrect

Mark 0.00 out of 1.00

Question ID #11456: Babbling ordinarily begins at about 4 to 5 months of age and initially includes:

Select one:

- ☐ A. phonemes from all languages.
- ☒ B. phonemes from the child's native language only. ✗ Incorrect
- ☐ C. morphemes from all languages.
- ☐ D. morphemes that the child has heard most frequently.

The correct answer is A.

Babbling involves the repetition of vowel and consonant sounds—e.g., bi-bi-bi and da-da-da. These are simple units of sound without meaning, definitive of a phoneme.

Answer B: Babbling initially consists of phonemes from all languages. By about 9 months, it narrows to include the sounds of the child's native language only.

Answer C: A morpheme is distinguished by having meaning. Babbling consists of sounds without meaning.

Answer D: A morpheme is distinguished by having meaning. Babbling consists of sounds without meaning.

Question 137

Correct

Mark 1.00 out of 1.00

Question ID #11457: Children obey rules during the second stage of Kohlberg's preconventional level of moral development, because:

Select one:

- ☐ A. they feel they have a personal duty to uphold rules and laws.
- ☐ B. everyone else is doing it.
- ☐ C. doing so helps them avoid punishment.
- ☒ D. doing so helps them satisfy their personal needs. ✓ Correct

The correct answer is D.

Kohlberg's theory of moral development consists of three levels, with each level including two stages. Instrumental hedonism is the second stage of the preconventional level. Children in this stage consider the correct action to be the one that best satisfies their own personal needs. Kohlberg illustrates this stage with the example of a 10-year-old boy's reply to what it means to be a good son: "Be good to your father, and he will be good to you."

Answer A: This is characteristic of the second stage of Kohlberg's conventional, not preconventional, level.

Answer B: This doesn't describe the second stage of the preconventional level.

Answer C: This is characteristic of the first stage of the preconventional level (punishment and obedience stage). For the exam, you want to be familiar with the characteristics of the six stages, which are described in the Lifespan Development chapter of the written study materials.

Question 138

Correct

Mark 1.00 out of 1.00

Question ID #11458: A 16-month-old child who calls her pet cat "kitty" sees a dog for the first time and calls it "kitty." The child is displaying _____ in Piaget's theory of cognitive development.

Select one:

- ☒ A. assimilation ✓ Correct
- ☐ B. accommodation
- ☐ C. categorization
- ☐ D. centration

The correct answer is A.

Piaget distinguished between two complementary processes in cognitive development: assimilation and accommodation. Assimilation involves incorporating new knowledge into existing cognitive structures or schemes. The child in the question doesn't know what a dog is and is incorporating it into her existing "kitty" scheme.

Answer B: Accommodation involves modifying an existing scheme or creating a new one.

Answer C: Piaget did not use the term "categorization" to describe the incorporation of new knowledge into an existing cognitive scheme.

Answer D: Centration is a limitation of the preoperational stage and refers to the tendency to focus on the most salient aspect of an object.

Question 139

Incorrect

Mark 0.00 out of 1.00

Question ID #11459: Children's successful adjustment to the divorce of their parents is most related to:

Select one:

- ☐ A. the frequency of contact with the noncustodial parent.
- ☒ B. the quality of the parent-child relationships prior to the divorce. ✗ Incorrect
- ☐ C. the child's ability to understand the cause(s) of the divorce.
- ☐ D. the degree of post-divorce conflict between the parents.

The correct answer is D.

The frequency and severity of post-divorce conflict between the parents has most consistently been linked to children's adjustment. Some experts argue that this factor, rather than divorce, determines post-divorce adjustment problems in children.

Answers A, B, and C: A number of child and parent factors have been linked to children's adjustment to the divorce of their parents, but Answer D is the strongest predictor.

Question 140

Incorrect

Mark 0.00 out of 1.00

Question ID #11461: Thomas and Chess's "goodness-of-fit" model (1977) predicts that maladjustment in children is due to:

Select one:

- ☐ A. a mismatch between the child's basic temperament and their parents' child rearing practices.
- ☐ B. a mismatch between the child's attachment behaviors and their parents' response to those behaviors.
- ☒ C. inconsistencies in the parenting styles of the child's caregivers. ✖ Incorrect
- ☐ D. inconsistencies in the child's sense of self and the feedback the child receives from caregivers about their behavior.

The correct answer is A.

Thomas and Chess concluded that it is not the child's early temperament that predicts future adjustment, but the match between the child's temperament and their caregivers' child rearing practices.

Answer B: Thomas and Chess studied temperament, not attachment.

Answer C: Thomas and Chess studied temperament, not parenting style.

Answer D: Thomas and Chess studied temperament, not self-esteem.

Question 141

Incorrect

Mark 0.00 out of 1.00

Question ID #11467: Stranger anxiety begins in most children at about ____ months of age.

Select one:

- ☐ A. 2 to 3
- ☒ B. 4 to 6 ✖ Incorrect
- ☐ C. 8 to 10
- ☐ D. 12 to 14

The correct answer is C.

Stranger anxiety involves anxious, fearful responses in the presence of a stranger, especially when a caregiver is not present. Most experts agree that it begins during the second half of the first year, although there may be disagreement as to the exact age of onset.

Answers A, B, and D: Stranger anxiety begins in most children at about 8 to 10 months of age.

Question 142

Correct

Mark 1.00 out of 1.00

Question ID #11468: Alice, age 14, is certain that everyone is looking at her because she has a large blemish in the middle of her forehead. Alice's belief, according to Elkind (1967), is a manifestation of:

Select one:

- ☐ A. self-conscious emotions.
- ☐ B. the personal fable.
- ☐ C. social referencing.
- ☒ D. the imaginary audience. ✓ Correct

The correct answer is D.

Elkind proposed that adolescents experience a renewed egocentrism that is manifested in several ways (1967). He used the term "imaginary audience" to describe the adolescent's belief that they are the focus of everyone's attention.

Answer A: Self-conscious emotions include shame, embarrassment, and pride; these are not relevant to Elkind's explanation for Alice's behavior.

Answer B: The personal fable is one manifestation of adolescent egocentrism but does not describe Alice's concern. It refers to the belief that one is special and unique and not subject to the same dangers as other people are.

Answer C: Social referencing refers to relying on the emotional response of another person to decide how to respond in an ambiguous situation.

Question 143

Incorrect

Mark 0.00 out of 1.00

Question ID #11471: Interactions between elements of the microsystem (e.g., between the family and the school) are part of the _____ in Bronfenbrenner's model (2004).

Select one:

- ☐ A. mesosystem
- ☐ B. exosystem
- ☒ C. macrosystem ✖ Incorrect
- ☐ D. endosystem

The correct answer is A.

Bronfenbrenner's ecological model distinguishes between five layers (levels) that influence a child's development: microsystem, mesosystem, exosystem, macrosystem, and chronosystem. The mesosystem is the second layer and consists of interactions between components of the microsystem (e.g., the parents' involvement in the child's school experiences and interactions between the child's church and community).

Answer B: The exosystem consists of elements in the social setting that indirectly affect the child's development (e.g., the parents' jobs).

Answer C: The macrosystem is the outermost layer and includes the values, laws, customs, etc. of the child's culture.

Answer D: The endosystem is not one of the levels identified by Bronfenbrenner.

Question 144

Incorrect

Mark 0.00 out of 1.00

Question ID #11475: The age range of Erikson's _____ stage of psychosocial development corresponds to Freud's phallic stage.

Select one:

- ☒ A. industry vs. inferiority ✖ Incorrect
- ☐ B. autonomy vs. shame and doubt
- ☐ C. basic trust vs. mistrust
- ☐ D. initiative vs. guilt

The correct answer is D.

Erikson's initiative vs. guilt stage is characteristic of children aged 3 to 6 years, which corresponds to Freud's phallic stage.

Answer A: The industry vs. inferiority stage is characteristic of children aged 6 to 11 years and corresponds to Freud's latency stage.

Answer B: The autonomy vs. shame and doubt stage occurs between the ages of 1 and 3 years and corresponds to Freud's anal stage.

Answer C: The basic trust vs. mistrust stage occurs from birth to 1 year of age and corresponds to Freud's oral stage. Erikson's psychosocial theory proposes that personality development occurs throughout the lifespan and involves eight stages. For the exam, be familiar with the names of the stages and the ages at which they occur.

Question 145

Incorrect

Mark 0.00 out of 1.00

Question ID #11479: A child with an insecure/avoidant pattern of attachment:

Select one:

- ☐ A. is very distressed when separated from their mother and continues to be highly anxious when she returns.
- ☐ B. is more anxious when their mother is present than absent and resists contact with her when she returns following separation.
- ☒ C. is very distressed when separated from their mother but pulls away from her when she returns. ✖ Incorrect
- ☐ D. shows little distress when separated from their mother and turns away from her when she returns.

The correct answer is D.

In Ainsworth's "strange situation," insecure/avoidant children are uninterested in exploration, show little distress when separated from their mothers, and avoid her when she returns.

Answer A: This does not describe any of the typical patterns in the "strange situation."

Answer B: This describes the pattern of disorganized/disoriented attachment.

Answer C: This describes the pattern of insecure/ambivalent attachment. The four attachment patterns described by Ainsworth and her colleagues (secure, insecure/ambivalent, insecure/avoidant, and disorganized/disoriented) are described in the Lifespan Development chapter of the written study materials. You'll want to become familiar with the characteristics associated with each pattern because you're likely to encounter a question similar to this one on the exam.

Question 146

Correct

Mark 1.00 out of 1.00

Question ID #11483: Konrad Lorenz's research on "imprinting" (1957) led to the search for _____ in human infants.

Select one:

- ☒ A. a critical period for attachment ✔ Correct
- ☐ B. a biological explanation for language acquisition
- ☐ C. a sensitive period for social referencing
- ☐ D. a biological mechanism for recognition memory

The correct answer is A.

Imprinting refers to the bond that develops during a critical period following birth in some non-human species. The ethologist Lorenz found that geese bonded to the first moving object they encounter during the first few days following birth. His research led to a search for a similar "critical period" for attachment in human infants.

Answer B: Lorenz's research on imprinting does not relate to language acquisition.

Answer C: The term "sensitive period" is relevant, but Lorenz's research did not lead to studies on social referencing.

Answer D: Lorenz's research on imprinting does not relate to cognition.

Question 147

Incorrect

Mark 0.00 out of 1.00

Question ID #11486: _____ is a key contributor to aggressive behavior in children, according to Gerald Patterson and his colleagues (1992).

Select one:

- ☐ A. The child's intelligence
- ☐ B. The child's basic personality
- ☒ C. The strength of the parent-child attachment ✖ Incorrect
- ☐ D. The parents' child rearing behaviors

The correct answer is D.

The social learning approach of Patterson and his colleagues focuses on the family factors that contribute to aggressiveness in children. Patterson et al.'s "coercive family interaction model" attributes aggression in children primarily to interactions between parents and their children, especially interactions involving the parents' child rearing behaviors.

Answer A: The child's intelligence was not a factor identified by Patterson et al.'s research.

Answer B: The child's personality was not a factor identified by Patterson et al.'s research.

Answer C: Although this answer refers to a family factor, attachment patterns are not the focus of this research.

Question 148

Correct

Mark 1.00 out of 1.00

Question ID #12145: The _____ is the least developed area of the brain at birth.

Select one:

- ☐ A. brain stem
- ☒ B. cerebral cortex ✔ Correct
- ☐ C. limbic system
- ☐ D. cerebellum

The correct answer is B.

The higher centers of the brain are the most complex and develop last. The cerebral cortex, which is responsible for higher-level cognitive skills, complex motor behaviors, language, and spatial skills, is almost completely undeveloped at birth.

Answer A: The brain stem, which controls life-maintaining functions, is the lowest brain level and is present at birth.

Answer C: The limbic system, in the mid-brain, is mostly developed at birth.

Answer D: Although recent studies have shown continued cerebellar development during childhood, the cerebellum, which primarily controls motor function, is more developed at birth than the cerebral cortex.

Question 149

Incorrect

Mark 0.00 out of 1.00

Question ID #12146: Most babies say their first words at about ____ months of age.

Select one:

- ☐ A. 7
- ☒ B. 9 ✖ Incorrect
- ☐ C. 12
- ☐ D. 15

The correct answer is C.

For the exam, be familiar with the language milestones of early childhood that are described in the Lifespan Development chapter of the written study materials. Most infants say their first recognizable word at 12 months of age.

Answers A, B, and D: Most babies say their first words at about 12 months of age.

Question 150

Incorrect

Mark 0.00 out of 1.00

Question ID #12148: Children begin to deliberately and regularly use rehearsal, elaboration, and organization as memory strategies by ____ years of age.

Select one:

- ☐ A. 2 to 3
- ☒ B. 5 to 7 ✖ Incorrect
- ☐ C. 9 to 10
- ☐ D. 13 to 15

The correct answer is C.

The research has shown that the deliberate and consistent use of the memory strategies listed in the question begins at about 9 to 10 years of age.

Answer A: The consistent and deliberate use of memory strategies does not occur until age 9 or 10.

Answer B: Preschoolers sometimes use memory strategies, but they do so in non-deliberate and often ineffective ways. In addition, children of this age can be taught to use memory strategies for a specific task but do not apply them to new tasks.

Answer D: The use of these strategies continues to be "fine-tuned" during adolescence, but their use begins earlier.

Question 151

Incorrect

Mark 0.00 out of 1.00

Question ID #12165: _____ involves intellectual disability and extreme obesity and is caused by a chromosomal deletion.

Select one:

- ☒ A. Down syndrome ✖ Incorrect
- ☐ B. Turner syndrome
- ☐ C. Klinefelter syndrome
- ☐ D. Prader-Willi syndrome

The correct answer is D.

Approximately 1 in 200 babies is born with a chromosomal abnormality. Prader-Willi syndrome is caused by a chromosomal deletion, which occurs when part of a chromosome is missing.

Answer A: Down syndrome is attributable to the presence of an extra chromosome, not a deleted chromosome.

Answer B: Turner syndrome is caused by the absence of a chromosome. It occurs only in females and involves the absence of one X chromosome.

Answer C: Klinefelter syndrome occurs in males and is due to the presence of two or more X chromosomes and a single Y chromosome.

Question 152

Incorrect

Mark 0.00 out of 1.00

Question ID #12168: The rooting reflex occurs when:

Select one:

- ☐ A. the newborn's cheek is touched.
- ☐ B. the newborn's foot is tickled.
- ☐ C. the newborn hears their caregiver's voice.
- ☒ D. the newborn hears an unexpected loud noise. ✖ Incorrect

The correct answer is A.

Reflexes are unlearned responses to particular stimuli in the environment. The rooting reflex occurs when the baby turns their head in the direction of a touch or stroke on their cheek.

Answer B: This describes the Babinski reflex.

Answer C: This does not describe the rooting reflex.

Answer D: This describes the Moro (startle) reflex.

Question 153

Incorrect

Mark 0.00 out of 1.00

Question ID #12988: Auditory localization in children:

Select one:

- ☒ A. is fully developed by 2 or 3 months of age. ✖ Incorrect
- ☐ B. does not begin to develop until the 8th or 9th month.
- ☐ C. has fully developed by about the end of the first year.
- ☐ D. shows a burst in development during the preschool years.

The correct answer is C.

Auditory localization refers to the ability to orient toward the direction of a sound (i.e., to turn one's head toward the sound). This ability is not consistently established until about 1 year.

Answer A: Infants exhibit some auditory localization during the first month of life, but between two and four months, there seems to be a loss of this ability. At four months, the ability returns, and by one year, it is almost completely established.

Answer B: As noted above, this ability is noted for a brief period in early infancy, so it is not correct to say it begins at 8 months.

Answer D: Preschool is not a relevant time frame for this ability.

Question 154

Correct

Mark 1.00 out of 1.00

Question ID #13699: Factors that predict adolescent drug use in Shedler and Block's longitudinal studies (1990) include:

Select one:

- ☐ A. peer pressure to use drugs.
- ☐ B. lack of information about the effects of drugs.
- ☒ C. alienation, impulsivity, and subjective distress. ✔ Correct
- ☐ D. early experimentation with drugs.

The correct answer is C.

This study of preschool to age 18 found that social maladjustment predates frequent drug use in adolescence.

Answer A: There is no evidence that peer pressure determines adolescent drug use.

Answer B: Lack of information is not a factor in adolescent drug use.

Answer D: Experimentation with drugs is common in adolescence and does not distinguish the teens that progress to frequent drug use.

Question 155

Correct

Mark 1.00 out of 1.00

Question ID #13713: Most infants take their first steps with support at about:

Select one:

- ☐ A. 6 to 7 months of age.
- ☒ B. 9 to 10 months of age. ✓ Correct
- ☐ C. 12 to 13 months of age.
- ☐ D. 15 to 16 months of age.

The correct answer is B.

Developmental motor ability at 9–10 months normally includes taking steps while holding onto furniture.

Answer A: Most children are not taking steps prior to 9 months.

Answer C: Walking without support typically occurs at 12–13 months.

Answer D: 15–16 months is well beyond the expected age for needing support to walk.

Question 156

Incorrect

Mark 0.00 out of 1.00

Question ID #13808: Considering the Rosenthal effect, students described to teachers as "academic successes" are likely to:

Select one:

- ☐ A. achieve more than the other students by the end of the school year.
- ☐ B. be mistreated by fellow students who are jealous of their status.
- ☒ C. exhibit academic anxiety due to pressure from the teacher. ✗ Incorrect
- ☐ D. be no different from the other students at the end of the school year.

The correct answer is A.

The Rosenthal Effect states that creating expectations for achievement has a self-fulfilling effect.

Answer B: Advising teachers that some students are achievers does not necessarily result in bullying.

Answer C: The Rosenthal Effect has not been linked to anxiety.

Answer D: Students perform better than peers in this situation.

Question 157

Incorrect

Mark 0.00 out of 1.00

Question ID #10348: Which of the following is true characteristic of sleeping patterns of older adults?

Select one:

- ☒ A. Increased REM sleep ✗ Incorrect
- ☐ B. A decreased need for sleep
- ☐ C. An advanced sleep phase
- ☐ D. A delayed sleep phase

The correct answer is C.

The circadian clock advances as we age, which results in an advanced sleep phase. This means that individuals become somnolent earlier in the evening and wake up earlier in the morning.

Answer A: Advanced age is associated with decreases in REM (not increases) and slow-wave sleep, which is a combination of Stage 3 and Stage 4 sleep.

Answer B: A lack of sleep at night is accompanied by increased somnolence during the day.

Answer D: A delayed sleep phase occurs when a person's sleep is delayed by two hours or more beyond what is a conventional bedtime.

Question 158

Incorrect

Mark 0.00 out of 1.00

Question ID #10738: Hypothyroidism is associated with:

Select one:

- ☐ A. depression and bradyphrenia.
- ☐ B. emotional lability, unrealistic fears and doubts, and impaired concentration.
- ☐ C. agitated paranoia, confusion, hallucinations, and delusions.
- ☒ D. unprovoked anger, episodic confusion, and lethargy or fatigue. ✗ Incorrect

The correct answer is A.

Depression accompanied by symptoms indicative of bradyphrenia may serve as evidence of untreated hypothyroidism.

Answer B: These symptoms are indicative of hyperthyroidism.

Answer C: These symptoms are indicative of hyperparathyroidism.

Answer D: This symptom presentation is typical for hypoglycemia.

Question 159

Correct

Mark 1.00 out of 1.00

Question ID #10761: A patient is shown a flower in her left visual field, and touches it with her left hand. She is then shown the flower in her right visual field and touches it with her right hand. This suggests that the woman has experienced damage to which of the following areas of her brain?

Select one:

- ☐ A. Hippocampus
- ☐ B. Cerebellum
- ☒ C. Corpus callosum ✓ Correct
- ☐ D. Amygdala

The correct answer is C.

Research on "split-brain" patients has found that severing the corpus callosum limits the amount of information that can be transferred from one hemisphere to the other.

Answer A: Although the hippocampus is involved with memory, damage to the hippocampus will not necessarily result in the behavior described in this question.

Answer B: The cerebellum governs coordinated movements.

Answer D: The amygdala is part of the limbic system and involved in the regulation of emotions.

Question 160

Correct

Mark 1.00 out of 1.00

Question ID #11009: The _____ is a key structure in the mediation of conditioned fear.

Select one:

- ☐ A. hippocampus
- ☐ B. thalamus
- ☒ C. amygdala ✓ Correct
- ☐ D. reticular formation

The correct answer is C.

Neurons in the amygdala are responsible for the formation of conditioned fear memory and the expression of conditioned fear response.

Answer A: The hippocampus is critical for storing memories for individual events.

Answer B: The main function of the thalamus is to relay motor and sensory signals to the cerebral cortex.

Answer D: The reticular formation plays a central role in states of consciousness like alertness and sleep.

Question 161

Incorrect

Mark 0.00 out of 1.00

Question ID #11495: When an individual sustains damage to the frontal lobe, which of the following is least likely to occur?

Select one:

- ☐ A. loss of movement in various parts of the body
- ☒ B. perseveration ✖ Incorrect
- ☐ C. inability to express language
- ☐ D. right-left disorientation

The correct answer is D.

Difficulty with differentiating between right and left is a hallmark symptom of Gerstmann syndrome and typically results from damage to the left parietal lobe.

Answer A: Both the pre-motor and motor areas are located in the frontal lobe. The pre-motor area is responsible for planning movement and the motor area is responsible for initiating voluntary muscle movement, so damage to the frontal lobe could result in difficulty with carrying out movement.

Answer B: The prefrontal cortex, responsible for executive functioning and many higher order cognitive processes, allows individuals to shift their attention, inhibit impulses, and engage in cognitive flexibility. When there is damage to this area, an individual may experience repetitive speech, behavior, or thoughts, also known as perseveration.

Answer C: Broca's area, located in the left frontal lobe, is responsible for the muscles that produce speech. Damage to this area can result in significant difficulty with articulation and speech production even though the individual may understand language and are aware of what they want to say.

Question 162

Incorrect

Mark 0.00 out of 1.00

Question ID #11497: What part of the brain plays a role in the etiology of seasonal affective disorder (SAD)?

Select one:

- ☐ A. Red nucleus
- ☐ B. Suprachiasmatic nucleus
- ☐ C. Tectum
- ☒ D. Striatum ✖ Incorrect

The correct answer is B.

The suprachiasmatic nucleus mediates sleep cycles, wake cycles, and circadian rhythms, all of which are affected in seasonal affective disorder.

Answer A: The red nucleus is a midbrain structure that is involved in motor coordination.

Answer C: The tectum is part of the midbrain and is involved in auditory and visual processing.

Answer D: The striatum is part of the basal ganglia and is involved in movement and cognitive processing.

Question 163

Incorrect

Mark 0.00 out of 1.00

Question ID #11499: Huntington's disease is a/an:

Select one:

- ☐ A. autosomal dominant disorder.
- ☒ B. autosomal recessive disorder. ✖ Incorrect
- ☐ C. X-linked disorder.
- ☐ D. Y-linked disorder.

The correct answer is A.

Autosomal dominant disorders occur when only one defective copy of an autosomal gene is required to cause a disease.

Answer B: An autosomal recessive disorder is defined by the inheritance of two mutated genes. Examples are sickle cell anemia and cystic fibrosis.

Answer C: X-linked disorders refer to genetic conditions associated with mutations in genes on the X-chromosome. Examples include Rett syndrome and fragile X syndrome.

Answer D: Y-linked disorders are conditions associated with genetic mutations on the Y-chromosome. Examples include congenital adrenal hyperplasia and Alagille syndrome.

Question 164

Correct

Mark 1.00 out of 1.00

Question ID #11501: Disinhibition, distractibility, and behavior changes are most associated with damage to the _____ lobe.

Select one:

- ☐ A. parietal
- ☒ B. frontal ✔ Correct
- ☐ C. temporal
- ☐ D. occipital

The correct answer is B.

The frontal lobe is involved in a variety of complex executive functioning tasks, including problem solving and regulating emotions. As a result, damage to this area can result in disinhibition (impulsivity), distractibility, and various behavior changes.

Answer A: Damage to the parietal lobe may cause right-left confusion (Gerstmann's Syndrome), agraphia (difficulty writing), acalculia (difficulty with math), aphasia (disorders of language), and/or agnosia (inability to perceive objects normally).

Answer C: Temporal lobe damage may cause disturbances in auditory and visual sensation and/or perception.

Answer D: Damage to the occipital lobe can result in loss of visual capability, inability to identify colors, and hallucinations.

Question 165

Correct

Mark 1.00 out of 1.00

Question ID #11502: Which response is consistent with the James-Lange theory of emotion?

Select one:

- ☐ A. I think, therefore I am.
- ☒ B. My heart is racing, therefore I am scared. ✓ Correct
- ☐ C. It's noon, so I must be hungry.
- ☐ D. That was a great birthday surprise, so I must be happy.

The correct answer is B.

The James-Lange theory of emotion states that an autonomic arousal and skeletal action comes before an emotion. More specifically, an event happens, then you appraise it (the cognitive aspect); this leads to an action (the behavioral aspect), which in turn leads to emotions (the feeling aspect).

Answer A: This is a phrase coined by the French philosopher René Descartes.

Answer C: This is a feeling based on a time, which does not fit the James-Lange theory of emotion.

Answer D: This answer is a feeling based on an event, which does not follow the James-Lange theory of emotion.

Question 166

Correct

Mark 1.00 out of 1.00

Question ID #11506: A 34-year-old female with a moderate intellectual disability is accompanied by a staff from her group home. The client presents with acute onset confusion, disorientation, combative behaviors, and appears to be responding to internal stimuli. She denies substance use and the group home staff corroborate this. Which of the following is the best first course of action?

Select one:

- ☐ A. Assess for other symptoms of a schizophrenia spectrum disorder and refer to a psychiatrist for psychopharmacological treatment.
- ☐ B. Recommend the group home staff utilize re-orientation techniques and memory cues to help ground the individual and ensure the environment is stable and quiet to prevent further confusion.
- ☐ C. Treat the client's combative behaviors using principles of Applied Behavior Analysis.
- ☒ D. Refer the client to a primary care physician to rule out a medical condition. ✓ Correct

The correct answer is D.

The client is presenting with symptoms of delirium, which is due to a physiological cause such as an infection, general medical condition or substance use/withdrawal. Hallmark symptoms include the acute onset of cognitive changes like disorientation, memory deficits, perceptual disturbances, and difficulty shifting attention. While delirium is more common in older adults, it can occur at any age. Once delirium is suspected, the underlying medical cause must be identified and treated.

Answer A: While assessing for other symptoms of a schizophrenia spectrum disorder and referring to a psychiatrist for medication is important, the first course of action should be to rule out a medical cause, especially due to the acute symptom onset.

Answer B: While treatment strategies for delirium involve reorientation techniques and memory cues, the first line of treatment involves addressing the underlying medical or physiological cause. After the medical concern is addressed, additional strategies for reorienting the individual and making their treatment environment comfortable are added to complement the medical treatment and support recovery.

Answer C: This would not be the first line of treatment. Although ABA can be used to reduce dangerous or challenging behaviors, while teaching safer, more functional behaviors for meeting an individual's needs, the first course of action is to rule out a medical condition impacting the individual's presentation.

Question 167

Incorrect

Mark 0.00 out of 1.00

Question ID #11509: Which of the following is true for someone with Broca's aphasia?

Select one:

- ☐ A. Pronunciation is unimpaired.
- ☐ B. Comprehension is seriously impaired, and it is difficult to name objects.
- ☐ C. The content of speech used is mostly nouns and verbs with poor pronunciation.
- ☒ D. The content of speech is grammatically correct but often nonsensical. ✖ Incorrect

The correct answer is C.

Broca's aphasia is also known as expressive aphasia and is characterized by partial loss of the ability to produce language (spoken, manual, or written), although comprehension generally remains intact.

Answer A: Wernicke's aphasia best describes unimpaired pronunciation.

Answer B: Impaired comprehension and difficulty naming objects are characteristics of Wernicke's aphasia.

Answer D: Nonsensical grammar aligns with Wernicke's aphasia.

Question 168

Correct

Mark 1.00 out of 1.00

Question ID #11511: A(n) _____ seizure is typically seen in children and characterized by periods of inattention, lapses in awareness, and staring.

Select one:

- ☐ A. tonic
- ☒ B. absence ✔ Correct
- ☐ C. clonic
- ☐ D. simple partial

The correct answer is B.

During an absence seizure, also referred to as a petit mal seizure, symptoms can include staring off into space, inattention, lapses in awareness, and repetitive blinking.

Answer A: Tonic phase is the beginning of a grand mal seizure where the muscles contract forcefully.

Answer C: Clonic means agitated. This phase of the seizure begins when the person begins jerking, trembling, and/or convulsing.

Answer D: A simple partial seizure is also referred to as a focal seizure and occurs in only one area of the brain, usually accompanied by an aura.

Question 169

Correct

Mark 1.00 out of 1.00

Question ID #11513: Agraphia, acalculia, finger agnosia, and left-right disorientation are symptoms of which of the following?

Select one:

- ☐ A. Creutzfeldt-Jakob disease
- ☐ B. Addison's disease
- ☒ C. Gerstmann syndrome ✓ Correct
- ☐ D. Geschwind syndrome

The correct answer is C.

Gerstmann Syndrome is a neuropsychiatric disorder characterized by agraphia, acalculia, finger agnosia, and left-right disorientation.

Answer A: Creutzfeldt-Jakob disease is a rare degenerative brain disease that is characterized by memory loss, behavioral changes, poor coordination, and visual disturbances.

Answer B: Addison's disease, also known as hypercortisolism, is an endocrine disorder with symptoms including abdominal pain, weakness, and weight loss.

Answer D: Geschwind syndrome (Gastaut-Geschwind) is a behavioral syndrome associated with temporal lobe epilepsy and is characterized by circumstantiality (excessive verbal output), hypergraphia (intense desire to write or draw), hyposexuality, emotional volatility, and, in some cases, hyperreligiosity.

Question 170

Correct

Mark 1.00 out of 1.00

Question ID #11516: Left temporal lobe damage causes which of the following symptoms?

Select one:

- ☒ A. Word recognition difficulty and impaired verbal memory ✓ Correct
- ☐ B. Poor judgment, impulsivity, and inappropriate behavior
- ☐ C. Prosopagnosia and agraphia
- ☐ D. Depression and apathy

The correct answer is A.

Left temporal lobe lesions disturb the recognition of words. Additionally, impaired memory for verbal material can result in damage to this area.

Answer B: Damage to the frontal lobe can impair judgment and result in inappropriate behavior and impulsivity.

Answer C: Prosopagnosia occurs as a result of damage to the fusiform gyrus. Agraphia is the loss of ability to communicate through writing.

Answer D: Depression and apathy have been linked to subcortical limbic brain regions and are not always correlated with damage to the brain.

Question 171

Incorrect

Mark 0.00 out of 1.00

Question ID #11518: Which of the following drugs is most likely to produce anticholinergic effects when administered at therapeutic doses?

Select one:

- ☐ A. fluoxetine
- ☐ B. fluvoxamine
- ☐ C. chlorpromazine
- ☒ D. carbamazepine ✖ Incorrect

The correct answer is C.

Chlorpromazine, generic for Thorazine, is a first generation antipsychotic. Many typical and atypical antipsychotic medications may cause anticholinergic effects like dry mouth, constipation, urinary retention, dry eyes, confusion, and memory difficulties.

Answer A: Fluoxetine, generic for Prozac, is also an SSRI. Anticholinergic effects are less likely with SSRI use.

Answer B: Fluvoxamine, generic for Luvox, is an SSRI. Most common side effects of SSRI's include restlessness, insomnia, gastrointestinal upset, frequent urination, and sexual dysfunction.

Answer D: Carbamazepine, generic for Tegretol, is an anticonvulsant used to treat mania. Side effects may include drowsiness, diarrhea, nausea/vomiting, and headache. Although carbamazepine toxicity or overdose can be associated with anticholinergic effects, risk is low in therapeutic doses.

Question 172

Incorrect

Mark 0.00 out of 1.00

Question ID #11522: Which of the following is an inhibitory neurotransmitter that also possesses analgesic properties?

Select one:

- ☒ A. glutamate ✖ Incorrect
- ☐ B. dopamine
- ☐ C. endorphins
- ☐ D. GABA

The correct answer is C.

Endorphins or “endogenous morphines” are inhibitory peptide neuromodulators that have analgesic properties and support the regulation of stress and pain.

Answer A: Glutamate is an excitatory neurotransmitter that is thought to play a role in the formation of long-term memories. Abnormal glutamate transmission is also associated with schizophrenia, autism spectrum disorder, depression, and obsessive-compulsive disorder.

Answer B: Dopamine is linked to thought, movement, and emotion, and plays a large role in the brain's reward system. The dopamine hypothesis explains how an excess of dopamine can result in the psychotic symptoms of schizophrenia.

Answer D: GABA is an amino acid and major inhibitory neurotransmitter that has a calming effect, and insufficient levels of GABA are often associated with anxiety.

Question 173

Correct

Mark 1.00 out of 1.00

Question ID #11526: Early memory loss associated with Alzheimer's disease is believed to be caused by deterioration of neurons in the hippocampus that secrete:

Select one:

- ☐ A. Gamma-Aminobutyric Acid (GABA).
- ☐ B. serotonin.
- ☐ C. dopamine.
- ☒ D. acetylcholine. ✓ Correct

The correct answer is D.

Acetylcholine (ACh) mediates motor functions as well as learning processes, and lower levels of ACh in the hippocampus have been linked to decreased alertness in Alzheimer's patients.

Answer A: Gamma-Aminobutyric Acid (GABA) is an inhibitory neurotransmitter. It decreases activity in the nervous system and plays a role in stress, anxiety, and fear.

Answer B: Serotonin has been linked to a variety of functions, including emotions and motor skills. Abnormalities in serotonin levels have been linked to sleep, appetite, and mood in Alzheimer's patients.

Answer C: Dopamine is responsible for transmitting signals between neurons in the brain. Dopamine pathways are involved in motor control and the release of various hormones.

Question 174

Incorrect

Mark 0.00 out of 1.00

Question ID #11529: Damage to the hippocampus is most likely to interfere with the ability to:

Select one:

- ☐ A. retrieve long-term memories.
- ☐ B. manipulate memory information.
- ☐ C. convert short-term memory to long-term memory.
- ☒ D. store memories. ✗ Incorrect

The correct answer is C.

The hippocampus is involved in converting immediate (short-term) memories into long-term memories.

Answer A: The hippocampus does not play a role in retrieving long-term memories.

Answer B: The hippocampus does not contribute to the manipulation of information.

Answer D: The amygdala plays a role in storing memories.

Question 175

Incorrect

Mark 0.00 out of 1.00

Question ID #11532: Eating foods containing tyramine (e.g., cheese, raisins) while taking a monoamine oxidase inhibitor (MAOI) is contraindicated because which of the following can occur?

Select one:

- ☐ A. Rebound effect
- ☒ B. Agranulocytosis ✖ Incorrect
- ☐ C. Tardive dyskinesia
- ☐ D. Increased blood pressure

The correct answer is D.

Taking an MAOI in combination with foods containing tyramine can cause an increase in blood pressure.

Answer A: A rebound effect occurs when the emergence or re-emergence of symptoms that were either absent or controlled while taking a medication appear after the medication has been discontinued.

Answer B: Agranulocytosis is an acute symptom involving a severe and dangerous leukopenia (lowered white blood cell count) that leads to a weakened immune system.

Answer C: Tardive dyskinesia is a disorder that results in involuntary, repetitive body movements.

Question 176

Correct

Mark 1.00 out of 1.00

Question ID #11538: Which of the following is a second-generation antipsychotic?

Select one:

- ☐ A. Paroxetine
- ☐ B. Phenelzine
- ☐ C. Fluoxetine
- ☒ D. Risperidone ✔ Correct

The correct answer is D.

Risperidone is a second-generation antipsychotic (atypical antipsychotic) that alleviates symptoms of schizophrenia without producing movement problems.

Answer A: Paroxetine (Paxil) is a common selective serotonin reuptake inhibitor (SSRI) that is similar to a tricyclic but has milder side effects.

Answer B: Phenelzine is a monoamine oxidase inhibitor (MAOI).

Answer C: Fluoxetine (Prozac) is an SSRI.

Question 177

Correct

Mark 1.00 out of 1.00

Question ID #11540: The ability to recognize the color of an object despite changes in the lighting is defined as which of the following?

Select one:

- ☐ A. Motion perception
- ☒ B. Color constancy ✓ Correct
- ☐ C. Saccade
- ☐ D. Visual agnosia

The correct answer is B.

Color constancy is the ability to recognize something as being the same color despite changes in lighting. Area 4 is important for color constancy.

Answer A: Motion perception is the process of inferring the speed and direction of elements in a scene based on visual, vestibular, and proprioceptive inputs.

Answer C: A saccade is a quick, simultaneous movement of both eyes between two or more phases of fixation in the same direction.

Answer D: Visual agnosia is an inability to recognize objects despite otherwise satisfactory vision.

Question 178

Correct

Mark 1.00 out of 1.00

Question ID #11544: Individuals who have sustained a traumatic brain injury are most likely to ____

Select one:

- ☐ A. experience retrograde amnesia only and as they recover their memories, they're more likely to recall recent events first and then slowly begin to recall more remote events.
- ☒ B. experience retrograde and anterograde amnesia and as they recover their memories, they're more likely to recall remote events first and then slowly recall more recent events. ✓ Correct
- ☐ C. experience anterograde amnesia only and as they recover their memories, they're more likely to recall remote events first and then slowly recall more recent events.
- ☐ D. experience anterograde and retrograde amnesia and as they recover their memories, they're more likely to recall recent events first and then slowly begin to recall more remote events.

The correct answer is B.

When an individual sustains a head trauma, they tend to suffer from both retrograde amnesia or the inability to recall events that occurred prior to the trauma and anterograde amnesia, difficulty forming new memories. As an individual recovers, they will remember remote memories first, followed by more recent memories leading up to the trauma, and finally, the ability to form new memories.

Answer A: Individuals tend to experience both retrograde and anterograde amnesia after a traumatic brain injury and are more likely to remember remote memories first, followed by slowly recalling more recent memories.

Answer C: This answer is partially correct in that remote memories are more easily recalled than recent memories; however, an individual sustaining a head trauma is more likely to experience memory loss for events prior to the trauma (retrograde amnesia) and the inability to form new memories (anterograde amnesia).

Answer D: Individuals experiencing a head trauma are more likely to experience both retrograde and anterograde amnesia, and when they do recall their memories, they typically recall more remote memories first, followed by recent memories.

Question 179

Incorrect

Mark 0.00 out of 1.00

Question ID #11545: What class of chemicals prevents apoptosis?

Select one:

- ☐ A. Neurotrophins
- ☒ B. Leukocytes ✗ Incorrect
- ☐ C. Prolactin
- ☐ D. Axons

The correct answer is A.

Neurotrophins are a class of proteins that induce the survival, development, and function of neurons. Nerve growth factor (NGF) is a type of neurotrophin that cancels the program for apoptosis.

Answer B: Leukocytes are part of the body's immune system, which helps fight infection and other diseases.

Answer C: Prolactin is the hormone that tells the body to make breast milk.

Answer D: Axons are the part of the neuron that transmits electrical impulses.

Question 180

Correct

Mark 1.00 out of 1.00

Question ID #11548: Which part of the autonomic nervous system facilitates vegetative, nonemergency responses.?

Select one:

- ☐ A. Sympathetic nervous system
- ☐ B. Central nervous system
- ☐ C. Peripheral nervous system
- ☒ D. Parasympathetic nervous system ✓ Correct

The correct answer is D.

The parasympathetic system is one of the two branches related to the autonomic nervous system. This specific part is called the rest and digest system.

Answer A: The sympathetic nervous system directs the body's rapid involuntary response to dangerous or stressful situations.

Answer B: The central nervous system controls most functions of the body and the mind.

Answer C: The main function of the peripheral nervous system is to connect the central nervous system to the limbs and organs.

Question 181

Incorrect

Mark 0.00 out of 1.00

Question ID #11555: Benzodiazepines with a short half-life (e.g., triazolam, midazolam) can cause which type of amnesia for a short period after the drug has worn off?

Select one:

- ☐ A. Retrograde amnesia
- ☐ B. Anterograde amnesia
- ☒ C. Transient global amnesia ✗ Incorrect
- ☐ D. Infantile amnesia

The correct answer is B.

Anterograde amnesia is the loss of memory for a short period after a drug has worn off.

Answer A: Retrograde amnesia is the loss of memory access to events that occurred or information that was learned in the past.

Answer C: Transient global amnesia is a sudden, temporary episode of memory loss that cannot be attributed to a more common neurological condition.

Answer D: Infantile amnesia (childhood amnesia) is the inability of adults to retrieve episodic memories (memories of situations or events) before the age of two to four years old.

Question 182

Correct

Mark 1.00 out of 1.00

Question ID #13097: A split-brain patient (patient with callosal syndrome) would likely be able to:

Select one:

- ☐ A. verbalize the word "spoon" after it has been projected to his left visual field.
- ☐ B. repeat a series of letters that have been whispered in his left ear.
- ☐ C. verbally identify an odor that has been presented to his right nostril.
- ☒ D. identify a spoon with his left hand after an image of a spoon has been projected to his left visual field. ✓ Correct

The correct answer is D.

An image presented to the left visual field would be processed in the right hemisphere, which controls the left hand. Therefore, a split-brain patient would be able to perform this task.

Answer A: Information projected to the left visual field would be transmitted directly to the right hemisphere. A split-brain patient would not be able to verbalize what he just saw.

Answer B: Information that entered the left ear would be delivered to the right hemisphere. Consequently, the split-brain patient would not be able to repeat the information.

Answer C: Olfactory signals do not cross the opposite side of the brain; therefore, stimulation that has entered the right nostril would be delivered to the right hemisphere.

Question 183

Incorrect

Mark 0.00 out of 1.00

Question ID #10000: A psychologist is attempting to assess the general intelligence of a six-year-old child with a severe hearing impairment. Which of the following tests would be most effective?

Select one:

- ☐ A. Halstead-Reitan
- ☒ B. KABC-II ✖ Incorrect
- ☐ C. Haptic Intelligence Scale
- ☐ D. Hiskey-Nebraska

The correct answer is D.

The Hiskey-Nebraska Test of Learning Aptitude is a measure of learning ability for children and adolescents ages 3:0 to 17:6 who have hearing or language impairments. It can be administered verbally or in pantomime.

Answer A: The Halstead-Reitan Neuropsychological Battery is a measure used to detect the presence of brain damage and determine its severity and possible location in individuals ages 15 and older.

Answer B: The Kaufman Assessment Battery for Children (KABC-II) is a measure of cognitive ability for children ages 3:0 to 18:11. While administration of the KABC-II does minimize the need for verbal instructions and responses, this is with intent to be culturally fair.

Answer C: The Haptic Intelligence Scale for the Adult Blind is a measure for adolescents and adults (16:0 and older) who are blind or partially sighted.

Question 184

Correct

Mark 1.00 out of 1.00

Question ID #10024: A psychologist administers the Wisconsin Card Sort Category Test and the Halstead-Reitan Neuropsychological Battery when evaluating a patient for brain damage. The psychologist likely believes that the patient has:

Select one:

- ☐ A. diffuse axonal injury (diffuse brain damage).
- ☒ B. frontal lobe damage. ✓ Correct
- ☐ C. temporal lobe damage.
- ☐ D. basal ganglia damage.

The correct answer is B.

The frontal lobe is involved in a number of functions including initiative, planning, and sequential task completion. Damage to the frontal lobe significantly impacts performance on the Wisconsin Card Sort and Halstead-Reitan Category Test, as strong performances on these tests are contingent on intact frontal lobe functioning.

Answer A: The assessments listed are used to assess frontal lobe functioning and lateral functioning, not diffuse brain functioning.

Answer C: The assessments listed are used to assess frontal lobe functioning and lateral functioning, not temporal lobe functioning.

Answer D: The assessments listed are used to assess frontal lobe functioning and lateral functioning, not functioning associated with the basal ganglia.

Question 185

Correct

Mark 1.00 out of 1.00

Question ID #10359: A person with a realistic orientation will likely be satisfied with job tasks that _____, according to Holland's theory about the importance of matching a person's personality with their work environment.

Select one:

- ☐ A. require creativity
- ☒ B. require mechanical, physical, and technical skills ✓ Correct
- ☐ C. are unambiguous and require the organization of data
- ☐ D. require scholarly analytical skills, such as scientific or mathematical activities

The correct answer is B.

Holland's six personality types are realistic, investigative, artistic, social, enterprising, and conventional ("RIASEC"). Individuals with a realistic personality type likely will be satisfied with job tasks that require mechanical, physical, and technical skills.

Answer A: Individuals with an artistic personality type likely will be satisfied with job tasks that require creativity.

Answer C: Individuals with a conventional personality type likely will be satisfied with job tasks that are unambiguous and require the organization of data.

Answer D: Individuals with an investigative personality type likely will be satisfied with job tasks that require scholarly analytical skills, such as scientific or mathematical activities.

Question 186

Incorrect

Mark 0.00 out of 1.00

Question ID #11931: The Peabody Picture Vocabulary Test (PPVT) was designed as a measure of receptive vocabulary for:

Select one:

- ☒ A. adolescents and adults with a visual impairment. ✗ Incorrect
- ☐ B. children and adolescents with a hearing or language impairment.
- ☐ C. children, adolescents, and adults with autism.
- ☐ D. children, adolescents, and adults with a motor or speech impairment.

The correct answer is D.

The Peabody Picture Vocabulary Test (PPVT) is a measure of receptive vocabulary developed to assess children, adolescents, and adults with a motor or a speech impairment. During the assessment, examiners ask examinees to point to (or otherwise indicate) the picture that best corresponds to the word verbally provided by the examiner.

Answer A: The Haptic Intelligence Scale is a measure designed for adolescents and adults with visual impairments.

Answer B: The Hiskey-Nebraska Test is a measure of intelligence for children and adolescents with a hearing or a language impairment.

Answer C: The PPVT is a measure of receptive vocabulary developed to assess children, adolescents, and adults with a motor or a speech impairment, not individuals with autism specifically.

Question 187

Incorrect

Mark 0.00 out of 1.00

Question ID #11938: The developer of a new occupational interest test conducts a study to determine which test items accurately distinguish between people who are employed in different occupations. The test developer is likely using which of the following methods of scale construction?

Select one:

- ☐ A. Empirical criterion keying
- ☒ B. Homogeneous keying ✖ Incorrect
- ☐ C. Factor analysis
- ☐ D. Multiple regression analysis

The correct answer is A.

The test developer is trying to determine which items distinguish between specific criterion groups (i.e., people employed in different occupations). Empirical criterion keying involves choosing items for different scales on the basis of how well the items distinguish between different criterion groups. This method was used in the development of the Kuder Occupational Interest Survey as well as the Occupational scales of the Strong Interest Inventory.

Answer B: Homogeneous keying is used when items are selected on the basis of the degree to which they measure the same domain.

Answer C: Factor analysis entails administering a large pool of items to examinees, factor analyzing the intercorrelations of items to identify underlying factors (traits), labeling the identified factors, and including items in the test so that each factor is adequately assessed.

Answer D: Multiple regression analysis is a multivariate technique that is useful when performance on two or more predictors will be used to estimate an individual's score on a criterion. It is not a method of scale construction.

Question 188

Incorrect

Mark 0.00 out of 1.00

Question ID #11944: On the Rorschach Inkblot Test, confabulation is most suggestive of which of the following?

Select one:

- ☐ A. Giftedness
- ☐ B. Antisocial personality disorder
- ☒ C. An attempt to malingering ✖ Incorrect
- ☐ D. Intellectual disability

The correct answer is D.

Confabulation on the Rorschach refers to overgeneralizing a part of the inkblot to the whole. Confabulation is associated with brain damage, emotional disturbance, or intellectual disability.

Answers A, B, and C: Confabulation is associated with brain damage, emotional disturbance, or intellectual disability.

Question 189

Correct

Mark 1.00 out of 1.00

Question ID #11947: The IQ concordance rate for biological (non-twin) siblings who are reared together is:

Select one:

- ☐ A. 0.85.
- ☐ B. 0.67.
- ☒ C. 0.45. ✓ Correct
- ☐ D. 0.22.

The correct answer is C.

The contribution of heredity to IQ is confirmed by studies showing that the greater the genetic similarity, the higher the concordance rate. Bouchard and Gue report an IQ concordance rate of 0.45 for biological (non-twin) siblings reared together.

Answer A: The IQ concordance rate for identical twins reared together is 0.85.

Answer B: The IQ concordance rate for identical twins reared apart is 0.67.

Answer D: The IQ concordance rate for biological parent and child living apart is 0.22.

Question 190

Correct

Mark 1.00 out of 1.00

Question ID #11953: In the case of *Larry P. v. Riles*, the court ruled that IQ tests:

Select one:

- ☐ A. are culturally fair.
- ☒ B. are racially and culturally biased. ✓ Correct
- ☐ C. are valid predictors of job performance for members of minority groups when used in conjunction with other measures.
- ☐ D. are valid measures of intelligence for members of minority groups when administered by an examiner of the same race/ethnicity.

The correct answer is B.

In the *Larry P. v. Riles* case, a suit was brought against the California State Department of Education and the San Francisco School Board on the grounds that the use of standardized IQ tests as a placement technique resulted in an over-representation of African American children in special education classes. Following expert testimony, the judge determined that IQ tests are racially and culturally biased, as well as have a discriminatory impact on Black children. The judge enjoined San Francisco public schools from using IQ tests to place Black children in special education classes, indicating they should not be used as placement tools for children of color.

Answer A: The court found that standardized IQ assessments are racially and culturally biased.

Answer C: The court case was not focused on job performance.

Answer D: The court did not find that the bias in standardized intellectual assessments is mitigated by the examiner's race/ethnicity.

Question 191

Incorrect

Mark 0.00 out of 1.00

Question ID #11958: The Bender-Gestalt II is a measure of:

Select one:

- ☐ A. fine motor skills.
- ☐ B. visual-motor integration.
- ☒ C. cognitive flexibility. ✗ Incorrect
- ☐ D. suicide risk.

The correct answer is B.

The Bender-Gestalt II is a brief assessment of visual-motor integration. During administration, the examinee copies geometric figures and then draws them from memory. It is used to assess visual-motor integration and assist in the assessment of neurological impairment.

Answer A: While fine motor skills influence performance on the Bender-Gestalt II, the test is a measure of visual-motor integration.

Answer C: The Bender-Gestalt II does not assess cognitive flexibility.

Answer D: The Bender-Gestalt II does not measure suicidality.

Question 192

Correct

Mark 1.00 out of 1.00

Question ID #11962: A psychologist administers the MMPI-2 to a 36-year old man who exhibits a number of symptoms suggestive of neurosis. The man receives a very low K scale score. On the basis of this score, the psychologist can tentatively conclude that the man:

Select one:

- ☐ A. tried to present himself in a favorable light.
- ☒ B. is very self-critical. ✓ Correct
- ☐ C. has a personality disorder.
- ☐ D. may have an organic brain disorder.

The correct answer is B.

The K (Correction) scale is one of the MMPI's validity scales. A very low score on the K scale indicates excessive frankness, self-criticism, or an attempt to "fake bad."

Answer A: An elevated K score might indicate an attempt to "fake good."

Answer C: The MMPI-2's validity scales were not designed to provide information about personality disorders.

Answer D: The MMPI-2's validity scales were not designed to detect organic brain disorders.

Question 193

Incorrect

Mark 0.00 out of 1.00

Question ID #10599: Anna is in the process of buying a new car and is having trouble deciding between two cars that are similar in terms of both positive and negative characteristics. In other words, Anna is facing a(n) _____ conflict.

Select one:

- ☐ A. approach-approach
- ☐ B. avoidance-avoidance
- ☒ C. single approach–avoidance ✖ Incorrect
- ☐ D. double approach–avoidance

The correct answer is D.

As its name implies, a double approach–avoidance conflict occurs when a person has to choose between two objects or events that have both positive and negative qualities.

Answer A: An approach-approach conflict occurs when a person has to choose between two equally positive events or objects. In this case, the two cars have both positive and negative characteristics, so this is not the best answer.

Answer B: An avoidance-avoidance conflict occurs when a person has to choose between two equally undesirable events or objects. Again, because the cars have both positive and negative qualities, this is not the best answer.

Answer C: A single approach–avoidance conflict occurs when a single object or event has both positive and negative qualities. Additional information about these conflicts is presented in the Social Psychology chapter of the written study materials.

Question 194

Incorrect

Mark 0.00 out of 1.00

Question ID #11855: Mary thinks her teacher is a real jerk for always assigning weekend homework. Mary's belief about her teacher is best explained by which of the following?

Select one:

- ☒ A. Overjustification hypothesis ✗ Incorrect
- ☐ B. Self-serving bias
- ☐ C. Fundamental attribution error
- ☐ D. Self-verification theory

The correct answer is C.

The fundamental attribution error is the tendency to attribute another person's behavior to dispositional factors (e.g., traits) and, therefore, to expect a great deal of consistency in behavior.

Answer A: The overjustification hypothesis predicts that internal motivation to perform a specific action is weakened when one is given external reinforcement for performing the action.

Answer B: The self-serving bias applies to the attributions one makes about one's own behavior and is not relevant to the situation described in this question.

Answer D: Self-verification theory predicts that people prefer receiving information about themselves from others that is consistent with their self-evaluations.

Question 195

Incorrect

Mark 0.00 out of 1.00

Question ID #11857: Which of the following best illustrates deindividuation?

Select one:

- ☐ A. A usually quiet, reserved person acts uncharacteristically violent in a crowd because he is able to do so anonymously.
- ☐ B. A victim of a crime is more likely to receive assistance when the crime occurs in a rural area rather than in a city.
- ☒ C. In a group decision-making situation, there is a tendency for critical thinking to be suspended when group cohesiveness is very strong. ✗ Incorrect
- ☐ D. A group member reduces her effort when she thinks other members are not exerting maximum effort.

The correct answer is A.

Deindividuation occurs in conditions that foster a loss of personal identity.

Answer B: This describes "bystander apathy."

Answer C: This describes "groupthink."

Answer D: This is referred to as the "sucker effect."

Question 196

Incorrect

Mark 0.00 out of 1.00

Question ID #11867: With regard to attitude change, inoculation is useful for:

Select one:

- ☐ A. increasing a person's resistance to persuasion.
- ☒ B. reducing a communicator's anxiety prior to delivering a message to a hostile audience. ✖ Incorrect
- ☐ C. distracting a person from a communicator's message.
- ☐ D. ensuring that attitude change represents internalization rather than mere compliance.

The correct answer is A.

The concept of inoculation (McGuire, 1969) was derived from the medical model and is based on the assumption that a person will be better able to resist a persuasive communication when they have been "inoculated" against it. Inoculation involves providing weak arguments against a position and counterarguments refuting those arguments. Inoculation has been shown to be an effective method for increasing an individual's resistance to persuasion.

Answer B: This is not the goal of inoculation.

Answer C: Distraction is associated with increased persuasiveness when a listener is initially opposed to a message and decreased persuasiveness when a listener is initially in favor of a message. Inoculation does not involve distraction.

Answer D: This is not a goal of inoculation.

Question 197

Incorrect

Mark 0.00 out of 1.00

Question ID #11872: Superordinate goals have been found useful for:

Select one:

- ☒ A. clarifying roles. ✖ Incorrect
- ☐ B. maximizing satisfaction and motivation.
- ☐ C. reducing intergroup conflict in order for opposing sides to reach common goals.
- ☐ D. increasing feelings of self-efficacy.

The correct answer is C.

Superordinate goals are those that allow opposing sides to work together toward a common goal. In their famous Robber's Cave study (1961), Sherif and his colleagues found that the introduction of superordinate goals was the most effective way of reducing intergroup hostility, allowing for joint efforts toward the common goal.

Answer A: Clarifying roles is not the objective of superordinate goals.

Answer B: Maximizing satisfaction and motivation are not the objectives of superordinate goals.

Answer D: Superordinate goals can be achieved only through intergroup cooperation, not merely individual efforts. These topics are all described in the Social Psychology chapter of the written study materials.

Question 198

Incorrect

Mark 0.00 out of 1.00

Question ID #11887: According to Bem's self-perception theory (1972):

Select one:

- ☐ A. people experience discomfort (dissonance) when their behaviors are not consistent with their attitudes, beliefs, or values.
- ☒ B. people enhance their own sense of self-worth by associating or identifying with others who are successful. ✖ Incorrect
- ☐ C. people tend to attribute their successes to dispositional factors and failures to situational factors.
- ☐ D. people infer their own attitudes and emotions by observing their behaviors and the circumstances in which those behaviors occur.

The correct answer is D.

Bem's self-perception theory predicts that when people aren't certain about their own attitudes and feelings, they make inferences about them based on their behavior, in the same way that they determine the states of other people.

Answer A: This relates to cognitive dissonance theory, not self-perception theory.

Answer B: This is not a prediction made by self-perception theory.

Answer C: This answer describes the self-serving bias.

Question 199

Correct

Mark 1.00 out of 1.00

Question ID #11888: The tendency to seek out and interpret information in ways that verify our existing beliefs is referred to as the:

Select one:

- ☐ A. hindsight bias.
- ☐ B. primacy effect.
- ☐ C. focusing effect.
- ☒ D. confirmation bias. ✔ Correct

The correct answer is D.

The confirmation bias is a cognitive bias which, as its name implies, involves focusing on and seeking out information that confirms our preconceptions.

Answer A: The hindsight bias refers to the tendency to believe that, after an outcome occurs, you could have predicted the outcome beforehand.

Answer B: The primacy effect refers to the tendency to remember material that occurred first better than material that occurred last.

Answer C: The focusing effect is the tendency to place too much importance (focus) on one aspect of an event or situation when predicting a future outcome.

Question 200

Correct

Mark 1.00 out of 1.00

Question ID #11894: The theory of planned behavior (Ajzen, 1991) predicts that:

Select one:

- ☐ A. attitudes are the result of behaviors.
- ☐ B. attitudes are the result of subjective norms, behavioral intentions, and behaviors.
- ☐ C. behaviors are the result of attitudes.
- ☒ D. behaviors are the result of attitudes, subjective norms, and behavioral intentions. ✓ Correct

The correct answer is D.

Ajzen's theory of planned behavior (1991) attributes behaviors to three factors: attitudes toward the behavior, subjective norms, and the intention to perform the behavior (behavioral intention).

Answers A, B, and C: Behaviors are the result of attitudes, subjective norms, and intentions.

Question 201

Correct

Mark 1.00 out of 1.00

Question ID #11911: The three components of attitudes are:

Select one:

- ☒ A. affect, behavior, and cognition. ✓ Correct
- ☐ B. affect, cognition, and aptitude.
- ☐ C. evaluation, experience, and application.
- ☐ D. knowledge, evaluation, and action.

The correct answer is A.

The three components of attitudes, as suggested by the ABC Model of Attitudes, are affect, behavior, and cognition.

Answers B, C, and D: Attitudes comprise affect, behavior, and cognition.

Question 202

Incorrect

Mark 0.00 out of 1.00

Question ID #13143: Individuals who frequently view violent TV shows:

Select one:

- ☐ A. tend to fear their environment more than those who view less TV violence.
- ☒ B. fear their environment somewhat less than people who report being less frequent viewers. ✖ Incorrect
- ☐ C. fear their environment much less than people who report being less frequent viewers.
- ☐ D. are about equal in terms of fear of their environment to people who report being less frequent viewers.

The correct answer is A.

The results of the studies are not entirely consistent, but, overall, they indicate that frequent viewing of media violence is associated with an increased fear of the environment.

Answers B, C, and D: Frequent viewing of media violence is associated with an increased, not decreased or equal, fear of the environment.

Question 203

Incorrect

Mark 0.00 out of 1.00

Question ID #11705: A researcher would use the randomized block ANOVA to analyze collected data in order to:

Select one:

- ☐ A. analyze the main and interaction effects of an extraneous variable.
- ☒ B. control measurement (random) error. ✖ Incorrect
- ☐ C. evaluate the effects of an independent variable on multiple dependent variables.
- ☐ D. evaluate the effects of one or more independent variables on a nominal dependent variable.

The correct answer is A.

The randomized block ANOVA is the appropriate inferential statistical test when a researcher uses blocking to control for an extraneous variable. When using the randomized block ANOVA, the extraneous ("blocking") variable is treated like an independent variable so that the respective researcher can evaluate its main and interaction effects on the dependent variable.

Answer B: A randomized block ANOVA would not be useful for controlling for measurement error. To control for measurement error, a researcher would place emphasis on study design strategies for increasing reliability and validity.

Answer C: A MANOVA would be useful for this purpose.

Answer D: The chi-square test would be useful for this purpose.

Question 204

Correct

Mark 1.00 out of 1.00

Question ID #11706: If a researcher has found heteroscedasticity in a scattergram, they have found that:

Select one:

- ☐ A. the relationship between the predictor and criterion cannot be described by a straight line.
- ☐ B. there is a restriction of range of scores on the predictor and/or the criterion.
- ☒ C. the variability (range) of scores on the criterion varies for different scores on the predictor. ✓ Correct
- ☐ D. there is a statistically significant correlation between the predictor and criterion.

The correct answer is C.

Heteroscedasticity means unequal variability. Heteroscedasticity occurs when the variability of scores on the criterion differs for different scores on the predictor (e.g., when there is a narrow range of criterion scores for low and high predictor scores but a wide range of criterion scores for moderate predictor scores). A figure illustrating heteroscedasticity and homoscedasticity is included in the Statistics and Research Design chapter of the written study materials.

Answer A: This is not a conclusion that can be drawn from knowing that there is heteroscedasticity in a scattergram. This is more reflective of a non-linear relationship between variables.

Answer B: This is not a conclusion that can be drawn from knowing that there is heteroscedasticity in a scattergram. A restricted range may show a linear relationship, but it will not show an unequal scatter (scattering) or the characteristic "funnel" shape.

Answer D: This is not a conclusion that can be drawn from knowing that there is heteroscedasticity in a scattergram. A statistically significant correlation between the predictor and criterion would be well fitted to the regression line and not vary across vectors as plots of heteroscedasticity do.

Question 205

Incorrect

Mark 0.00 out of 1.00

Question ID #11712: Researchers usually prefer parametric statistical tests over non-parametric tests because they are more "powerful." This means that the use of a parametric test to analyze collected data in a research study helps ensure that:

Select one:

- ☐ A. a false null hypothesis will be retained.
- ☐ B. a true null hypothesis will be retained.
- ☐ C. a false null hypothesis will be rejected.
- ☒ D. the null hypothesis will be rejected. ✖ Incorrect

The correct answer is C.

Statistical power is the ability to detect a false null hypothesis. Rejecting a false null hypothesis is an accurate description of power. Note: If you're having trouble remembering what power is or what the difference between a Type I and a Type II error is, the Decision Outcomes table in the Statistics and Research Design chapter may be helpful.

Answer A: Retaining a false null hypothesis is a Type II error.

Answer B: This is not a description of power. Power refers to the ability to reject a null hypothesis when it is false, or the probability of avoiding a Type II error.

Answer D: Power is the ability to reject a false null hypothesis, not just to the ability to reject any null hypothesis.

Question 206

Incorrect

Mark 0.00 out of 1.00

Question ID #11714: Which of the following techniques would be most useful for obtaining information on the cognitive processes used by students while they solve complex problems?

Select one:

- ☐ A. Event sampling
- ☐ B. Situation sampling
- ☒ C. Functional analysis ✗ Incorrect
- ☐ D. Protocol analysis

The correct answer is D.

Protocol analysis (also known as the "think aloud" technique) is used to identify the mental processes that occur during the solution of problems or the performance of tasks. Of the techniques listed, protocol analysis is the only one researchers use to study cognitive processes.

Answer A: Event sampling is a behavioral observation and data collection technique that is useful when the behavior of interest occurs infrequently.

Answer B: Situation sampling is a behavioral observation and data collection technique that involves observing a behavior in a variety of situations.

Answer C: A functional analysis is used to identify the functions of a behavior (i.e., the antecedents and consequences that maintain the behavior).

Question 207

Incorrect

Mark 0.00 out of 1.00

Question ID #11717: Of 100 students surveyed on a college campus, 48 voted Republican and 52 voted Democrat in the last election. On another college campus, 63 of the 100 students surveyed voted Republican and 37 voted Democrat. Which of the following statistical tests is the appropriate technique for determining if there is a statistically significant difference in voting preferences at the two colleges?

Select one:

- ☒ A. Two-way ANOVA ✗ Incorrect
- ☐ B. Students t-test
- ☐ C. Chi-square test
- ☐ D. Mann-Whitney U test

The correct answer is C.

The chi-square test is used when data are reported as the frequency of observations, which is the case in this study (i.e., the analysis will involve comparing the frequencies (numbers) of Republican and Democrat voters at the two schools.

Answer A: The two-way ANOVA is used when a study involves two independent variables and data on the dependent variable represent an interval or ratio scale.

Answer B: The t-test is used to compare two means.

Answer D: The Mann-Whitney U test is used when the analysis involves comparing rank-ordered data obtained from two independent samples.

Question 208

Incorrect

Mark 0.00 out of 1.00

Question ID #11722: When the relationship between the predictor (the X variable) and the criterion (the Y variable) is curvilinear and both variables are measured on an interval or ratio scale, the appropriate correlation coefficient is:

Select one:

- ☐ A. phi.
- ☐ B. tau.
- ☒ C. rho. ✗ Incorrect
- ☐ D. eta.

The correct answer is D.

Eta is used to measure the relationship between two continuous (interval or ratio) variables when their relationship is nonlinear. The choice of a correlation coefficient is based on several factors including the scale of measurement of the variables and the shape of the relationship between them (linear vs. non-linear).

Answer A: The phi coefficient is appropriate when both variables are true (natural) dichotomies.

Answer B: Kendall's tau is appropriate when both variables are measured on an ordinal scale.

Answer C: Rho (also known as the Spearman rank-order correlation coefficient) is used when both variables are measured as ranks.

Question 209

Incorrect

Mark 0.00 out of 1.00

Question ID #11733: The magnitude of the standard error of the mean increases as:

Select one:

- ☒ A. the sample size increases and the population variance decreases. ✖ Incorrect
- ☐ B. the sample size and population variance both increase.
- ☐ C. the sample size and population variance both decrease.
- ☐ D. the sample size decreases and the population variance increases.

The correct answer is D.

Knowing the formula for the standard error of the mean will help you identify the correct answer to this question. The standard error of the mean is equal to the population standard deviation divided by the square root of the sample size. As the population standard deviation increases and/or the sample size decreases, the standard error increases in magnitude. Refer to the Statistics and Research Design chapter of the written study materials for a more detailed description of the standard error of the mean.

Answer A: This is the opposite of what would occur. As the magnitude of the standard error of the mean increases, the sample size decreases and the population variance increases.

Answer B: As the magnitude of the standard error of the mean increases, the sample size would decrease, not increase.

Answer C: Half of this statement is correct; the sample size would decrease when the magnitude of the standard error of the mean increases. However, as the magnitude of the standard error of the mean increases, the population variance would also increase, not decrease.

Question 210

Correct

Mark 1.00 out of 1.00

Question ID #11746: Autocorrelation is most likely to be a problem when using which of the following research designs?

Select one:

- ☒ A. Time-series ✓ Correct
- ☐ B. Factorial
- ☐ C. Between groups
- ☐ D. Solomon four-group

The correct answer is A.

Autocorrelation refers to the correlation between measurements of the dependent variable when it is repeatedly administered to the same participants. Autocorrelation is a problem in repeated measures designs because it can artificially inflate the value of the inferential statistic, which will increase the probability of making a Type I error. Of the research designs listed in the answers, repeated measurement of the dependent variable is only characteristic of the time series design, which is a type of repeated measures (within subjects) design.

Answer B: Factorial designs include two or more independent variables and do not necessarily involve repeated measurements of the dependent variable.

Answer C: Autocorrelation refers to the correlation between measurements of the dependent variable when it is repeatedly administered to the same participants. A between groups design is used to compare outcomes (measurements of the dependent variable) between different groups of participants and does not directly relate to inflated values and the increased probability of making a Type I error.

Answer D: The Solomon four-group design is used evaluate the impact of pretesting and does not relate to inflated statistical values and the increased probability of making a Type I error.

Question 211

Correct

Mark 1.00 out of 1.00

Question ID #11751: When using multiple regression, multicollinearity occurs when:

Select one:

- ☒ A. the predictors are highly correlated with one another. ✓ Correct
- ☐ B. the criterion measures are highly correlated with one another.
- ☐ C. there is a low correlation between the predictors and the criterion.
- ☐ D. there is a high (significant) correlation between the predictors and the criterion.

The correct answer is A.

The term "multicollinearity" is used to describe high correlations between predictors (X variables). Additional information on multiple regression and multicollinearity is in the Statistics and Research Design chapter of the written study materials.

Answer B: Multicollinearity occurs when the predictors (i.e., independent variables) are highly correlated with one another, not the criterion (i.e., dependent) variables.

Answer C: Multicollinearity occurs when the predictors (i.e., independent variables) are highly correlated with one another, not when there is a low correlation between the predictors and criterion.

Answer D: Multicollinearity occurs when the predictors are highly correlated with one another, not when the predictors and criterion are highly correlated.

Question 212

Incorrect

Mark 0.00 out of 1.00

Question ID #11752: You would use the Solomon four-group design in order to:

Select one:

- ☒ A. eliminate carryover effects. ✖ Incorrect
- ☐ B. reduce demand characteristics.
- ☐ C. evaluate the impact of pretesting.
- ☐ D. evaluate the effects of history and maturation.

The correct answer is C.

The purpose of the Solomon four-group design is to evaluate the impact of pretesting on a study's internal and external validity. The Solomon four-group design combines the pretest-posttest control group design with the posttest-only control group design.

Answer A: Effects that carry over from one experimental condition to another are not related to the Solomon four-group design; you would use a Latin Square design or counterbalancing to account for carryover effects.

Answer B: You would not use the Solomon four-group design to correct for bias created by the experimenter's expectations or participants' perceptions of the purpose of the study.

Answer D: The purpose of the Solomon four-group design is to evaluate the impact of pretesting on a study's internal and external validity. While history and maturation are considered threats to the internal consistency aspect of validity, you would typically address history and maturation by reducing the amount of time between the pretest and posttest.

Question 213

Incorrect

Mark 0.00 out of 1.00

Question ID #11755: The hallmark of true experimental research, in contrast to quasi-experimental research, is that a researcher would:

Select one:

- ☒ A. operationally define the independent and dependent variables. ✗ Incorrect
- ☐ B. use parametric tests to analyze the obtained data.
- ☐ C. randomly select participants from the population.
- ☐ D. randomly assign participants to treatment groups.

The correct answer is D.

The key feature distinguishing true experimental research from quasi-experimental research is the ability to randomly assign participants to groups so that a researcher can make causal inferences about the relationships between variables. This is the hallmark of true experimental research.

Answer A: An operational definition is a precise description of a variable in a way that facilitates its measurement. Variables are operationally defined when using either a true or quasi-experimental research strategy.

Answer B: The choice of a parametric or nonparametric statistical test is based on the characteristics of the data, not the research strategy used.

Answer C: Random selection is not a requirement for either true or quasi-experimental research. For the EPPP, you will need to know the difference between random assignment to groups and random sampling. Refer to the Statistics and Research Design chapter of the written study materials for clarification.

Question 214

Incorrect

Mark 0.00 out of 1.00

Question ID #11776: A distribution of 250 scores is positively skewed and has a range of 1 to 50. In this distribution, which of the following is an accurate description of the measures of central tendency in relationship to one another?

Select one:

- ☐ A. The median is the highest score and the mean is the lowest score.
- ☒ B. The mode is the highest score and the mean is the lowest score. ✖ Incorrect
- ☐ C. The mean is the highest score and the mode is the lowest score.
- ☐ D. The mean is the highest score and the median is the lowest score.

The correct answer is C.

In a positively skewed distribution, the "tail" is extended on the high side of the distribution (i.e., most of the scores are "piled up" in the low end of the distribution, while a few scores are in the high end). In this distribution, the mean is the highest value, the mode is the lowest value, and the median is between the mean and the mode. A figure illustrating the relationship between the mean, median, and mode in skewed distributions is included in the Statistics and Research Design chapter of the written study materials.

Answer A: The median is defined as the midpoint of a frequency distribution, so it cannot be the highest score. If the mean were the lowest score, this would result in a negatively skewed distribution.

Answer B: The mode is the most frequently occurring score. When the mode is the highest score and the mean is the lowest score, this would be a negatively skewed distribution.

Answer D: The mean would be the highest score in a positively skewed distribution, but the median would be the middle score as it is defined as the midpoint of a frequency distribution. By definition, the median cannot be the lowest or highest score.

Question 215

Incorrect

Mark 0.00 out of 1.00

Question ID #13493: When using stepwise multiple regression to explain the greatest amount of variation in Y using the fewest possible X variables, you:

Select one:

- ☐ A. use the Spearman-Brown formula to adjust the size of the multiple correlation coefficient as each X variable is added or subtracted.
- ☐ B. use R-squared (coefficient of multiple determination) to determine if predictability is substantially affected by adding or subtracting another X variable.
- ☒ C. use r (zero order correlation coefficient) to determine which X variable has the highest correlation with the X variables ✗ Incorrect already introduced into the equation.
- ☐ D. use the eigenvalues to determine which predictor explains the greatest proportion of the remaining variability in Y.

The correct answer is B.

The coefficient of multiple determination (which is the squared value of R) is used to determine if adding or subtracting a predictor has a significant effect on the proportion of variability in Y that has been explained by the predictors included in the multiple regression equation. Recalling that multiple regression is used for the purpose of prediction will help you pick the correct response.

Answer A: The Spearman-Brown formula is used to estimate the effects of increasing or decreasing the length of a test on its reliability coefficient and is not used in this situation.

Answer C: It is important to check the correlations between the predictors in order to avoid the problem of multicollinearity, but this is not the best response.

Answer D: You should associate the term "eigenvalues" with principal components analysis, not multiple regression.

Question 216

Incorrect

Mark 0.00 out of 1.00

Question ID #11779: A group of 250 high school seniors took an achievement test. The test's mean was 50, its standard deviation was 5, and the test scores were normally distributed. If you wanted to use test scores to select the top 16% of the students, you would set the cutoff score at:

Select one:

- ☐ A. 55.
- ☐ B. 60.
- ☒ C. 65. ✗ Incorrect
- ☐ D. 70.

The correct answer is A.

50% of examinees obtain scores at or below the mean, and an additional 34% obtain scores that fall between the mean and one standard deviation above the mean in a normal distribution; 50% plus 34% equals 84%. Consequently, the score that is one standard deviation above the mean divides the distribution into two sections: 84% of the people in the distribution obtain scores at or below one standard deviation above the mean and the remaining 16% obtain higher scores. The test described in this question has a mean of 50 and a standard deviation of 5, so the score that is one standard deviation above the mean is 55.

Answer B: A score of 60 would be two standard deviations above the mean and would represent approximately the top 2.5% of students.

Answer C: A score of 65 would be three standard deviations above the mean and would represent the top .01 % of students.

Answer D: A score of 70 would be four standard deviations above the mean.

Question 217

Correct

Mark 1.00 out of 1.00

Question ID #11781: When a test's reliability has been estimated by splitting the test in half and correlating scores on the two halves, you would use which of the following to correct the resulting reliability coefficient?

Select one:

- ☐ A. Correction for attenuation formula
- ☐ B. Standard error of measurement
- ☐ C. Kuder-Richardson 20
- ☒ D. Spearman-Brown formula ✓ Correct

The correct answer is D.

Split-half reliability tends to underestimate a measure's reliability. Consequently, a correction formula is often used to estimate the measure's reliability coefficient if the measure was based on the full length of the test. The Spearman-Brown formula (also known as the Spearman-Brown prophecy formula) is commonly used to correct the split-half reliability coefficient but can also be used to estimate the reliability coefficient of a test after it has been lengthened or shortened.

Answer A: The correction for attenuation formula is used to estimate the predictor's validity coefficient if the predictor and/or criterion were perfectly reliable.

Answer B: The standard error of measurement is used to calculate the range within which an examinee's true score is likely to fall given their obtained score.

Answer C: Kuder-Richardson 20 (KR-20) is a type of internal consistency reliability measure that is used when test items are scored dichotomously.

Question 218

Incorrect

Mark 0.00 out of 1.00

Question ID #11789: Which of the following would be useful for determining the extent to which an examinee's actual criterion score is likely to deviate from their predicted criterion score?

Select one:

- ☐ A. Standard error of estimate
- ☐ B. Standard error of measurement
- ☐ C. Standard error of the difference
- ☒ D. Standard error of the mean ✖ Incorrect

The correct answer is A.

The relationship between a predictor and a criterion is never "perfect." A predicted criterion score may, or may not, be the actual criterion score. The standard error of estimate is used to construct the range within which an examinee's true criterion score is likely to fall given their predicted criterion score. This range is referred to as a confidence interval.

Answer B: The standard error of measurement is used to construct a confidence interval around an examinee's obtained (not predicted) score.

Answer C: The standard error of the difference is used to determine whether a difference score is significant. A difference score compares two test scores and contains measurement error from both test scores.

Answer D: The standard error of the mean is the standard deviation of the sampling distribution of means and is not used to construct a confidence interval around a predicted score.

Question 219

Incorrect

Mark 0.00 out of 1.00

Question ID #11791: An educational psychologist designs a screening test to identify underachieving first- and second-grade children who have a learning disability. The psychologist should be most concerned that her test has adequate _____ validity.

Select one:

- ☐ A. content
- ☐ B. construct
- ☐ C. concurrent
- ☒ D. predictive ✖ Incorrect

The correct answer is C.

Concurrent validity is a type of criterion-related validity and is of concern when the purpose of the test is to estimate an individual's current status on some external criterion. Screening tests are typically used to estimate the results of a more thorough evaluation (the criterion), which, in this case, would be a more thorough diagnostic procedure.

Answer A: Content validity is of most concern when test items are expected to be a representative sample of a particular content domain.

Answer B: Construct validity is of concern for tests designed to measure a hypothetical trait or construct such as motivation or self-esteem.

Answer D: The screening test is being used to estimate current status and not to predict future status. As such, concurrent validity is of greater concern than predictive validity.

Question 220

Incorrect

Mark 0.00 out of 1.00

Question ID #11806: An assumption underlying _____ is that observed covariation among a set of variables is due to one or more underlying common dimensions.

Select one:

- ☐ A. factor analysis
- ☐ B. path analysis
- ☐ C. trend analysis
- ☒ D. multiple regression ✗ Incorrect

The correct answer is A.

The primary function of factor analysis is to identify the factors that underlie the intercorrelations among a set of variables. Covariation is another word for correlation, so this question is asking what technique is used to determine what accounts for the intercorrelations among a set of variables.

Answer B: Path analysis is used to test causal models for the relationships among a set of variables.

Answer C: Trend analysis is a type of analysis of variance that is used to assess linear and nonlinear trends when the independent variable is quantitative.

Answer D: Multiple regression is used to predict a score on a criterion based on scores of two or more predictors.

Question 221

Incorrect

Mark 0.00 out of 1.00

Question ID #11812: An item discrimination index (D) of ____ indicates that all examinees in the high-scoring group and none in the low-scoring group answered the item correctly.

Select one:

- ☐ A. 1
- ☒ B. -1 ✖ Incorrect
- ☐ C. 0.5
- ☐ D. 0

The correct answer is A.

An item discrimination index of +1.0 indicates that all of the high-scoring and none of the low-scoring examinees answered the item correctly. The item discrimination index ranges from -1.0 to +1.0 and is calculated by subtracting the percent of low-scoring examinees who answered the item correctly (examinees who obtained low total scores on the test) from the percent of high-scoring examinees who answered the item correctly (examinees who obtained high total scores on the test).

Answer B: An item discrimination index of -1.0 indicates that all of the low-scoring and none of the high-scoring examinees answered the item correctly.

Answer C: An item discrimination index of .50 indicates that the 50% fewer of the examinees in the low-scoring group (versus the high-scoring group) answered the item correctly.

Answer D: An item discrimination index of 0 indicates that the same percent of examinees in the low- and high-scoring groups answered the item correctly.

Question 222

Incorrect

Mark 0.00 out of 1.00

Question ID #11834: When a predictor's reliability coefficient is .81, its criterion-related validity coefficient can be:

Select one:

- ☒ A. no less than .81. ✗ Incorrect
- ☐ B. no greater than .81.
- ☐ C. no less than .90.
- ☐ D. no greater than .90.

The correct answer is D.

A test's reliability limits its validity; that is, an unreliable test cannot be valid. A predictor's validity coefficient can be no greater than the square root of its reliability coefficient. In this situation, the predictor's reliability coefficient is .81, so its validity coefficient can be no greater than the square root of .81, which is .90.

Answer A: The formula for the relationship between a predictor's reliability and validity requires the square root of the predictor's reliability coefficient. An answer of .81 does not reflect the correct use of the formula since .81 *is* the predictor's reliability coefficient.

Answer B: The formula for the relationship between a predictor's reliability and validity requires the square root of the predictor's reliability coefficient. An answer of .81 does not reflect the correct use of the formula since .81 *is* the predictor's reliability coefficient.

Answer C: A predictor's validity coefficient can be no greater than the square root of its reliability coefficient, so the formula places an upper limit on the validity coefficient. The validity coefficient can be less than the square root of its reliability coefficient. In this situation, the predictor's reliability coefficient is .81, and the square root of .81 is .90. Therefore, the validity coefficient can be less than .90.

Question 223

Incorrect

Mark 0.00 out of 1.00

Question ID #11835: In test construction, shrinkage is associated with:

Select one:

- ☐ A. differential validity.
- ☒ B. incremental validity. ✖ Incorrect
- ☐ C. cross-validation.
- ☐ D. process validation.

The correct answer is C.

In the context of test construction, shrinkage refers to a reduction in the magnitude of a measure's criterion-related validity coefficient. Cross-validation refers to validating a predictor with a new sample. The validity coefficient typically "shrinks" (becomes smaller) on cross-validation because the chance factors operating in the original sample are not all present in the cross-validation sample.

Answer A: A test has differential validity when it has different validity coefficients for different groups.

Answer B: Incremental validity refers to the extent to which a predictor increases decision-making accuracy.

Answer D: Process validation describes how a process will continue to meet pre-determined standards.

Question 224

Incorrect

Mark 0.00 out of 1.00

Question ID #11836: The slope of an item characteristic curve (ICC) indicates which of the following?

Select one:

- ☐ A. The item's ability to discriminate between high and low achievers
- ☐ B. The item's level of difficulty
- ☐ C. The susceptibility of the item to social desirability effects
- ☒ D. The probability that the item can be answered correctly by guessing ✖ Incorrect

The correct answer is A.

The various item response theory models produce item characteristic curves (ICCs) that provide information on either one, two, or three parameters—difficulty, discrimination, and probability of guessing correctly. An item's ability to discriminate between high and low achievers is indicated by the slope of the ICC—the steeper the slope, the greater its discrimination.

Answer B: An item's level of difficulty is indicated by the ability level (charted on the horizontal axis) at which 50% of examinees in the sample answer the item correctly.

Answer C: The ICC does not measure susceptibility to social desirability.

Answer D: The probability of guessing correctly is indicated by the point at which the ICC intercepts the vertical axis.

Question 225

Incorrect

Mark 0.00 out of 1.00

Question ID #11839: When assessing the test-retest reliability of your newly developed personality test, you obtain a reliability coefficient of .80. This means that:

Select one:

- ☒ A. 80% of variability in test scores is shared variability. ✗ Incorrect
- ☐ B. 64% of variability in test scores is shared variability.
- ☐ C. 80% of variability in test scores is true score variability.
- ☐ D. 64% of variability in test scores is true score variability.

The correct answer is C.

Reliability is a measure of the extent to which a test consistently measures the attribute(s) assessed by the test. A reliability coefficient is interpreted directly as the proportion of variability in obtained test scores that reflects true score variability.

Answer A: The reliability coefficient does not share variability with other measures.

Answer B: The reliability coefficient is not squared in order to make an interpretation, and the reliability coefficient does not share variability with other measures. The value of .64 represents the square of the reliability coefficient of .80.

Answer D: Although this answer references the reliability coefficient as a true score of variability, the value of .64 is the square of the reliability coefficient of .80. The reliability coefficient is never squared for interpretation; it is interpreted directly as a measure of true score variability.
