Question 1

Not answered

Marked out of 1.00

Question ID #13891: The procedures known as "time-out" and "response cost" share in common which of the following?

Select one:

- ☐ A. Both are forms of operant extinction
- ☐ B. Both entail withholding or removing positive stimuli
- ☐ C. Both involve reinforcing alternative behaviors
- ☐ D. Both entail using negative reinforcement

The correct answer is B.

Time-out involves removing opportunities for reinforcement for a period of time following a behavior to reduce that behavior. Response cost entails removing positive reinforcement (e.g., a desirable activity) following a behavior to eliminate the behavior.

Answer A: Operant extinction entails withholding reinforcement from a previously reinforced response in order to eliminate or decrease that response. Time-out is usually classified as a type of negative punishment, but it may be considered a form of extinction if it is the continuous removal of a reinforcer from a previously reinforced response. Response cost is an application of negative punishment and is not considered a form of extinction; therefore, this answer choice is not correct.

Answer C: Differential reinforcement combines positive reinforcement with extinction and involves reinforcing alternative behaviors while ignoring the target behavior. Time-out and response cost are both examples of negative punishment and do not utilize differential reinforcement.

Answer D: Negative reinforcement is used to increase (not decrease) a behavior.

Question 2

Not answered

Marked out of 1.00

Question ID #13986: "Multicollinearity" could be expected to:

Select one:

- ☐ A. cause the values of the regression coefficients to vary substantially from sample to sample
- ☐ B. cause the multiple correlation coefficient to vary substantially from sample to sample
- ☐ C. increase as the number of dependent variables decreases
- ☐ D. decrease as the correlation between independent variables increases

The correct answer is A.

Multicollinearity occurs when predictors in a multiple regression equation correlate highly with one another. When predictors are correlated and the predictors and criterion are administered to different samples and new regression coefficients (beta weights) are derived for each sample, there tends to be a great deal of fluctuation in the size of the weights. (It isn't necessary for you to understand why this is so for the exam – just know that it is!)

Answer B: The actual relationship between the predictors and criterion shouldn't change much from sample to sample as the result of multicollinearity, so the multiple correlation coefficient won't change substantially.

Answer C: You may have been able to eliminate this response because it doesn't really make any sense.

Answer D: By definition, multicollinearity INCREASES as the correlation between predictors increases.

Question 3

Not answered

Marked out of 1.00

Question ID #13797: Dr. Best is attempting to set the optimal cutoff score for a new screening test designed to identify people at risk for drug abuse. Using the data he collected when evaluating the test's criterion-related validity, he finds that lowering the cutoff score on the screening test:

Select one:

- ☐ A. increases the number of true positives and true negatives
- ☐ B. decreases the number of true positives and true negatives
- ☐ C. increases the number of true and false positives
- ☐ D. decreases the number of true and false positives

The correct answer is C.

Lowering the predictor (screening device) cutoff score increases the number of "positives" and decreases the number of "negatives." "Positives" are individuals who are identified by a predictor as having the attribute being assessed - in this case, people who are at risk for drug abuse. Lowering the predictor cutoff increases the number of true and false positives.

Answer A: The answer, "increases the number of true positives and true negatives", is incorrect. See explanation for response C.

Answer B: The answer, "decreases the number of true positives and true negatives", is incorrect. See explanation for response C.

Answer D: The answer, "decreases the number of true and false positives", is incorrect. See explanation for response C.

Question 4

Not answered

Marked out of 1.00

Question ID #13702: Dr. Jones, a licensed clinical psychologist, hires a psychology graduate student to administer the MMPI-2 to some of his clients. This is:

Select one:

- ☐ A. unethical since psychological tests should be administered only by licensed professionals
- ☐ B. ethical as long as Dr. Jones accepts full responsibility for the consequences of testing
- ☐ C. ethical only if the student has completed at least one graduate-level course in psychological testing
- ☐ D. ethical only if Dr. Jones provides the student with appropriate training and supervision

The correct answer is D.

Of the alternatives given, this response is most consistent with the requirements of the Standard 2.05 of the Ethics Code and Principle II.7 of the Canadian Code of Ethics for Psychologists. The minimum competence requirements for the administration of psychological tests are not well-defined in the Ethics Code or Standards for Educational and Psychological Testing. However, Standard 2.05 states that "Psychologists who delegate work to employees, supervisees, or research or teaching assistants or who use the services of others, such as interpreters, take reasonable steps to (1) avoid delegating such work to persons who have a multiple relationship with those being served that would likely lead to exploitation or loss of objectivity; (2) authorize only those responsibilities that such persons can be expected to perform competently on the basis of their education, training, or experience, either independently or with the level of supervision being provided; and (3) see that such persons perform these services competently."

Answer A: APA's ethical guidelines do not require that psychological tests be administered by licensed professionals only.

Answer B: Dr. Jones is, of course, ultimately responsible for the activities of his assistant. However, this is not sufficient.

Answer C: The completion of a single course in psychological testing would probably be insufficient training for the administration of psychological tests.

Question 5

Not answered

Marked out of 1.00

Question ID #13495: As a treatment for Tourette's Disorder, the selective serotonin reuptake inhibitors (SSRIs):

Select one:

- ☐ A. are more effective than haloperidol or pimozide for alleviating tics
- ☐ B. are useful for reducing obsessive-compulsive symptoms that often accompany this disorder
- ☐ C. cannot be used in conjunction with haloperidol or pimozide because of the risk for a toxicity syndrome
- ☐ D. are contraindicated because of their exacerbating effects on tics

The correct answer is B.

Several psychotropic medications are used to treat Tourette's Disorder and comorbid symptoms. For example, an SSRI is usually useful for alleviating the obsessive-compulsive symptoms that often accompany this disorder.

Answers A, C, and D: Antipsychotic medications, such as haloperidol and pimozide are most often prescribed to treat Tourette's Disorder. However, SSRIs are often useful for alleviating obsessive-compulsive symptoms that often accompany Tourette's Disorder. Moreover, psychostimulants are frequently avoided to treat comorbid ADHD symptoms because they may increase tics in some individuals.

Question 6

Not answered

Marked out of 1.00

Question ID #13000: With regard to Schizophrenia, there is some evidence that the higher rate found among African American individuals may be due to:

Select one:

- ☐ A. genetic factors
- ☐ B. misdiagnosis
- ☐ C. lower recovery rates
- ☐ D. a higher risk for complications during birth

The correct answer is B.

Although the research on the relation between race/ethnicity and Schizophrenia is limited, there is some evidence that African American individuals have a slightly higher rate of Schizophrenia than other groups. And the results of the existing studies suggest that African Americans with other disorders (especially Bipolar Disorder, depression, and alcohol-related organic disorders) are often misdiagnosed as having Schizophrenia because their symptoms include auditory and visual hallucinations. See, e.g., NIMH Epidemiologic Catchment Area Study, reported in American Psychiatric Association, Ethnic Minority Elderly: A Task Force Report of the American Psychiatric Association, Washington, DC, APA, 1994.

Answer A: There is no evidence that the higher rate of Schizophrenia found among African American individuals may be due to genetic factors. See explanation for answer B.

Answer C: There is no evidence that the higher rate of Schizophrenia found among African American individuals may be due to lower recovery rates. See explanation for answer B.

Answer D: There is no evidence that the higher rate of Schizophrenia found among African American individuals may be due to a higher risk for complications during birth. See explanation for answer B.

Question 7

Not answered

Marked out of 1.00

Question ID #13920: According to Brier (1994), which of these populations has a higher risk of arrest and conviction for antisocial behavior?

Select one:

- ☐ A. Children diagnosed with Tourette's syndrome and ADHD
- ☐ B. Children diagnosed with ADHD and a Specific Learning Disorder
- ☐ C. Adults diagnosed with ADHD
- ☐ D. Adults diagnosed with Tourette's syndrome and a Specific Learning Disorder

The correct answer is B.

Between 20% to 30% of children with a Specific Learning Disorder are also diagnosed with ADHD. According to Brier (1994), these children are at a higher risk for antisocial behavior and for arrest and conviction for antisocial behavior.

Answer A: This is not true.

Answer C: This population's risk level is not as high as children with ADHD and a Specific Learning Disorder.

Answer D: According to Brier, children diagnosed with ADHD and a Specific Learning Disorder are at a higher risk level.

Question 8

Not answered

Marked out of 1.00

Question ID #14417: Which of the following types of biofeedback is likely to be most effective for reducing migraine headaches?

Select one:

- ☐ A. skin conductance
- ☐ B. blood volume pulse
- ☐ C. EMG (electromyography)
- ☐ D. EEG (electroencephalograph)

The correct answer is B.

Several studies indicate that blood volume pulse biofeedback is as effective or as more effective than skin temperature biofeedback for treating migraine headaches. Blood volume pulse is measured using a photoplethysmograph (PPG) that monitors change in blood flow in the blood vessels beneath the skin. [See Y. Nestoriuc & A Martin, Efficacy of biofeedback for migraine: A meta-analysis, Pain, 128 (1-2), 111-127, 2007.]

Answer A: Skin conductance biofeedback provides information on autonomic arousal and is used primarily to reduce stress and anxiety reactions.

Answer C: EMG biofeedback is useful for muscle tension headaches but has not been found to more effective than blood volume pulse biofeedback for treating migraine headaches.

Answer D: EEG biofeedback provides information on brain activity and is not used as a treatment for migraine headaches.

Question 9

Not answered

Marked out of 1.00

Question ID #11848: For a number of years, Cameron has tried to get close to his parents without much success. He is now 16 years old and has decided that is isn't worth it to keep trying. As a result, he and his parents are more like roommates, than family, sharing a living space but with very little interaction. What type of attachment does this scenario exemplify?

Select one:

- ☐ A. Laissez-faire
- ☐ B. Unresolved/disorganized
- ☐ C. Dismissing/avoidant
- ☐ D. Permissive

The correct answer is C.

Children with dismissing/avoidant attachment styles interact very little with their caregiver, show little distress when they leave and avoid or ignore them when they return. Parents of avoidant children can be very impatient and unresponsive or, at the other extreme, provide their children with too much stimulation.

Answer A: Laissez-faire is a French term meaning "to let people do as they please." Related to attachment and parenting, laissez-faire parenting refers to the permissive or indulgent style of parenting where parents are warm and caring but place few demands on the child.

Answer B: These children exhibit fear of their caregivers, a dazed or confused facial expression, and a variety of other disorganized attachment behaviors. Children with this type of attachment have typically experienced trauma or abuse.

Answer D: Permissive (indulgent) parents are warm and caring but make few demands and are nonpunitive. In this scenario, Cameron's parents place few demands on him, but he lacks the warmth and caring aspect to be a permissive parenting situation.

Question 10

Not answered

Marked out of 1.00

Question ID #13007: Studies comparing the communication styles of men and women suggest that:

Select one:

- ☐ A. in comparison to men, women interrupt others more often
- ☐ B. in comparison to women, men interrupt others more often
- ☐ C. in comparison to men, women interrupt women (but not men) more often
- ☐ D. in comparison to women, men interrupt men (but not women) more often

The correct answer is B.

This is another one of those questions that is difficult to answer because the research is far from consistent. Of the responses given, this is the best one. Males are more likely to do the interrupting, while females are more likely to be the "victims" of interruptions.

Answer A: The answer, "in comparison to men, women interrupt others more often", is incorrect. See explanation for response D.

Answer C: The answer, "in comparison to men, women interrupt women (but not men) more often", is incorrect. See explanation for response D.

Answer D: The answer, "in comparison to women, men interrupt men (but not women) more often", is incorrect. See explanation for response D.

Question 11

Not answered

Marked out of 1.00

Question ID #14404: All of the following are extrapyramidal side effects from antipsychotic medications EXCEPT _____.

Select one:

- ☐ A. agranulocytosis
- ☐ B. akathisia
- ☐ C. tardive dyskinesia
- ☐ D. acute dystonias

The correct answer is A.

Agranulocytosis is a serious side effect (not considered extrapyramidal) that can occur with antipsychotic medications. It is a drug-induced blood disorder that is characterized by a severe reduction in the number of white blood cells in the circulating blood.

Answer B: Akathisia is an extrapyramidal side effect of antipsychotic medication. It is an uncontrolled sense of inner restlessness and is often mistaken for anxiety. Akathisia can be alleviated with anticholinergic agents.

Answer C: Tardive dyskinesia is generally a late-onset extrapyramidal side effect that is often irreversible. Symptoms include involuntary sucking and smacking movements with the mouth and lips and can include chorea in the trunk and extremities.

Answer D: Acute dystonias are extrapyramidal side effects which are muscle spasms and prolonged muscular contractions, usually in the head and neck.

Question 12

Not answered

Marked out of 1.00

Question ID #14416: Sweating, speeded up mental processes, inability to sleep or relax, trembling, nervousness, palpitations, and loss of weight despite increased food intake are characteristic of which of the following endocrine disorders?

Select one:

- ☐ A. hyperglycemia
- ☐ B. hyperthyroidism
- ☐ C. adrenal insufficiency
- ☐ D. hypoparathyroidism

The correct answer is B.

The symptoms listed in this question are characteristic of hyperthyroidism, which is caused by excessive secretion of thyroxin by the thyroid gland.

Answer A: Hyperglycemia is due to excessive glucose in the blood. Its symptoms include fatigue, polydipsia, polyuria, polyphagia, weight loss, poor wound healing, and recurrent infections.

Answer C: Adrenal insufficiency (Addison's disease) is due to a lower-than-normal production of cortisol by the adrenal glands and is characterized by weight loss, orthostatic hypotension, weakness, fatigue, and hyperpigmentation.

Answer D: Hypoparathyroidism is caused by lower-than-normal levels of parathyroid hormone. Its symptoms include muscle cramping and twitching, tingling in the lips and fingers, hair loss, and dry skin.

Question 13

Not answered

Marked out of 1.00

Question ID #14419: Symptoms of _____ include neurological effects (headache, nystagmus, tremor, dizziness), changes in mental state (irritability, confusion, delirium), and cardiac arrhythmia, which can progress to coma and death.

Select one:

- ☐ A. serotonin syndrome
- ☐ B. neuroleptic malignant syndrome
- ☐ C. agranulocytosis
- ☐ D. hyperphagia

The correct answer is A.

Serotonin syndrome is potentially life-threatening precipitated by the use of serotonergic drugs. This syndrome consists of a combination of mental status changes, neuromuscular hyperactivity, and autonomic hyperactivity.

Answer B: A potentially fatal side effect of antipsychotic drugs is neuroleptic malignant syndrome. This syndrome is characterized by a rapid onset of motor, mental, and autonomic symptoms including muscle rigidity, tachycardia, hyperthermia, and altered consciousness.

Answer C: Agranulocytosis is a marked decrease in certain types of white blood cells resulting from the use of atypical antipsychotics.

Answer D: Hyperphagia, or polyphagia, is an abnormally strong sensation of hunger or desire to eat, often leading to overeating. This issue does not subside after eating and often leads to a rapid intake of excessive quantities of food.

Question 14

Not answered

Marked out of 1.00

Question ID #12316: At age 8, a girl receives a WISC FSIQ score of 144. When she is retested at age 12, she obtains a score of 138. Which of the following best accounts for this decline in her IQ score?

Select one:

- ☐ A. Demand characteristics
- ☐ B. Cohort effects
- ☐ C. Normal aging effects
- ☐ D. Statistical regression

The correct answer is D.

Statistical regression refers to the tendency of extreme scores to regress toward the mean on retesting and may threaten a study's internal validity whenever participants are chosen on the basis of their extreme scores on a pretest. Although statistical regression is typically used in the context of scores obtained by a group of examinees (rather than an individual examinee), of the answers given, it is the best choice.

Answer A: Demand characteristic refers to experimental participants forming an interpretation of the experiment's purpose and then changing their behavior accordingly. See explanation for answer D.

Answer B: Cohort effect refers to variations in a study over time among subjects who share in common some type or time frame of experience. See explanation for answer D.

Answer C: Normal aging effects does not account for this decline in IQ score. See explanation for answer D.

Question 15

Not answered

Marked out of 1.00

Question ID #11985: Which of the following statements about Kohlberg's theory of moral development and culture is true?

Select one:

- ☐ A. Stages 5 and 6 have been found in all cultures
- ☐ B. Kohlberg's scoring system is appropriate for all cultures
- ☐ C. Moral reasoning is more culture-specific than Kohlberg envisioned
- ☐ D. People around the world shift from Stage 3 to Stage 4 at approximately the same time

The correct answer is C.

Kohlberg's research was limited to mid-Western, individualistic culture, which resulted in excluding concepts like interdependence, social harmony, and the role of cultural socialization in non-Western settings. As a result, Kohlberg's theory of moral development was not as universal as he once posited because it did not account for moral concepts from diverse cultures.

Answer A: Because of differences in moral concepts and values in different cultures, Kohlberg's stages were not as universal as originally thought.

Answer B: Kohlberg's research focused on Western philosophical beliefs and values, so his scoring system is not universal for all cultures and highly depends on the culture's values and moral concepts.

Answer D: Because of differences in moral concepts and values in different cultures, Kohlberg's stages are not easily applied or appropriate to apply to diverse cultures.

Question 16

Not answered

Marked out of 1.00

Question ID #13922: Lee, Oh, & Mountcastle (1992) hold that indigenous healing practices share all of the following commonalities except:

Select one:

- ☐ A. a rejection of White cultural norms and healing practices
- ☐ B. a reliance on community and family networks to care for the disturbed individual
- ☐ C. integration of religious and spiritual practices
- ☐ D. incorporation of respected community healers

The correct answer is A.

Based on their review of 16 non-Western indigenous practices, Lee, Oh, and Mountcastle (1992) conclude that these practices share three characteristics: First, they rely on community and family networks to care for the disturbed individual. Second, the religious and spiritual practices of the community are integrated into the healing process. Third, the healing process is often conducted by a traditional healer or other respected member of the community. However, a rejection of White cultural norms is not inherently universal.

Answer B: Lee et al. found that one important commonality is the incorporation of community and family.

Answer C: Integrated spiritual practices was also found to be a unifying factor.

Answer D: Inclusion of local healers was found to be a third and final commonality.

Question 17

Not answered

Marked out of 1.00

Question ID #12305: A researcher is studying the ability of college students to remember lists of related word pairs (e.g., dog-cat, chair-table). Prior to studying the to-be-remembered list of word pairs, the experimental group is presented with a list of opposite word pairs such as tall-short, while the control group completes multiplication problems. What results should the researcher expect when the two groups are subsequently asked to recall the word pairs?

Select one:

- ☐ A. Due to retroactive interference, the control group will recall more word pairs
- ☐ B. Due to retroactive interference, the experimental group will recall more word pairs
- ☐ C. Due to proactive interference, the experimental group will recall fewer word pairs
- ☐ D. Due to proactive interference, the control group will recall fewer word pairs

The correct answer is C.

This question describes a standard proactive interference study. During the first phase, the experimental group is presented with a list of word pairs (e.g., tall-short) and the control group engages in an unrelated arithmetic task. During the second phase, the experimental and control groups both study the to-be-remembered word pairs (e.g., dog-cat). During the third phase, participants in both groups are asked to recall the word pairs. For the experimental group, the two tasks are similar, and the first list of word pairs interferes with the ability to learn or recall the second list. This is referred to as proactive interference. For the control group, the two tasks are dissimilar, and there is less interference. Consequently, the control group will remember more words than the experimental group.

Answer A: It is not true that due to retroactive interference, the control group will recall more word pairs. See explanation for answer C.

Answer B: It is not true that due to retroactive interference, the experimental group will recall more word pairs. See explanation for answer C.

Answer D: It is not true that due to proactive interference, the control group will recall fewer word pairs. See explanation for answer C.

Question 18

Not answered

Marked out of 1.00

Question ID #13981: Which of the following therapies is characterized by the dual goals of helping clients take responsibility for and experience the natural consequences of their actions?

Select one:

- ☐ A. Transactional analysis
- ☐ B. Individual psychology
- ☐ C. Personal construct therapy
- ☐ D. Reality therapy

The correct answer is D.

The term "responsibility" is a key one in this question and may have helped you identify the correct response. According to Glasser, a "success identity" results when one takes responsibility for fulfilling one's own needs and does so in ways that do not interfere with the ability of others to do the same thing.

Answer A: The ultimate goal of transactional analysis is to promote client autonomy.

Answer B: The goal of Adler's individual psychology is to help clients develop a more adaptive style of life.

Answer C: The goal of Kelly's personal construct therapy is to help clients identify and revise or replace maladaptive personal constructs so that they are better able to "make sense" of their experiences.

Question 19

Not answered

Marked out of 1.00

Question ID #13189: For a diagnosis of enuresis, the person must be at least ____ years old.

Select one:

- ☐ A. five
- ☐ B. six
- ☐ C. seven
- ☐ D. eight

The correct answer is A.

Enuresis is characterized by repeated voiding of urine into the bed or clothes at least twice a week for at least three consecutive months. Urination is usually involuntary but can be intentional. For this diagnosis, the person must be at least five years of age or the equivalent developmental level.

Answers B, C, and D: These responses are incorrect as an individual must be at least five years old to be diagnosed with enuresis.

Question 20

Not answered

Marked out of 1.00

Question ID #12915: When a statistical test enables a researcher to reject a false null hypothesis, the test is said to have_____.

Select one:

- ☐ A. statistical significance
- ☐ B. statistical power
- ☐ C. internal validity
- ☐ D. clinical significance

The correct answer is B.

Statistical power refers to the probability that the test correctly rejects a null hypothesis.

Answer A: Statistical significance helps quantify whether a result is likely due to chance or to some factor of interest.

Answer C: Internal validity refers to the extent to which a cause-and-effect relationship established in a study cannot be explained by other factors. In other words, the changes in the IV, produced change in the DV and it wasn't due to chance or other factors.

Answer D: Clinical significance is the practical importance of a treatment effect or whether it has a real genuine and noticeable effect on daily life.

Question 21

Not answered

Marked out of 1.00

Question ID #13377: Disruptive Mood Dysregulation Disorder:

Select one:

- ☐ A. is diagnosed two times more often in adolescents than in adults
- ☐ B. cannot be diagnosed for the first time in adults
- ☐ C. must have a duration of one year in children and two years in adults
- ☐ D. must have a duration of one year in children and adults

The correct answer is B.

The diagnosis of Disruptive Mood Dysregulation Disorder requires a combination of severe and recurrent temper outbursts. This diagnosis cannot be assigned for the first time before the individual is six years old or after he or she is 18 years of age. Moreover, the onset of symptoms must be before age 10.

Answer A: Disruptive Mood Dysregulation Disorder should not be made for the first time in individuals who are 18 years of age or older.

Answers C and D: These responses are incorrect as this diagnosis should not be made for the first time in adults.

Question 22

Not answered

Marked out of 1.00

Question ID #10700: Dr. Anderson is a new psychologist hired to work in a university counseling center. At orientation, he meets a psychology intern who is also new to the site. Dr. Anderson is close in age to the student and finds himself attracted to her. If Dr. Anderson decides to pursue an intimate relationship with the student, he will be acting _____.

Select one:

- ☐ A. ethically as long as he does not supervise her client caseload
- ☐ B. ethically, provided he communicates with the administrators of the counseling center about his intentions
- ☐ C. unethically
- ☐ D. unethically, because he could be accused of sexual harassment

The correct answer is C.

Standard 7.07 states that "psychologists do not engage in sexual relationships with students or supervisees who are in their department, agency, or training center or over whom psychologists have or are likely to have evaluative authority."

Answer A: This answer fails to account for the other ways in which the psychologist might oversee the student's work, including through routine performance evaluations, training seminars, and outreach to the community.

Answer B: The APA's Ethics Code does not indicate that exceptions are granted provided administrators are aware of the situation.

Answer D: This answer is incorrect, because while it may be true he could be accused of sexual harassment, that is not the reason becoming sexually involved with the student is unethical.

Question 23

Not answered

Marked out of 1.00

Question ID #12927: If a researcher wanted to simplify a data set by reducing a larger number of variables to a smaller set of variables that explain the intercorrelations among those variables, they would use which of the following statistical techniques?

Select one:

- ☐ A. Factor analysis
- ☐ B. Cluster analysis
- ☐ C. Multi-trait multimethod matrix
- ☐ D. Cross validation

The correct answer is A.

Factor analysis is used to determine the underlying factors (attributes) that are assessed by a set of test items, subtests, or other measures. It is a technique used to reduce a large number of variables into fewer numbers of factors by extracting the maximum common variance from all variables.

Answer B: Cluster analysis is used to group people or objects into a smaller number of mutually exclusive and exhaustive subgroups (clusters) based on their similarities.

Answer C: Multi-trait multimethod matrix is used to evaluate a measure's construct validity and provides information on the test's convergent and divergent validity. The multitrait-multimethod matrix is used to assess construct (convergent and divergent) validity.

Answer D: Cross validation refers to the tendency for the size of the correlation coefficient to shrink and the predictive accuracy of the regression equation to decrease whenever a multiple correlation coefficient and multiple regression equation are used (cross-validated) on another sample.

Question 24

Not answered

Marked out of 1.00

Question ID #13919: Use of multicomponent behavior therapy in conjunction with nicotine replacement therapy as an intervention for cigarette smoking:

Select one:

- ☐ A. is no better than nicotine replacement therapy alone
- ☐ B. is no better than behavior therapy alone
- ☐ C. is better than nicotine replacement therapy alone only for individuals who have developed tolerance for nicotine
- ☐ D. is better than nicotine replacement therapy alone, especially in terms of long-term effects

The correct answer is D.

There is some evidence that, in terms of short-term effects, a combined treatment does not have significant advantages over nicotine replacement therapy alone. However, in terms of long-term abstinence, the combined treatment is best. See R. C. Klesges, K. D. Ward, and M. DeBon, Smoking cessation: A successful behavioral/pharmacologic interface, *Clinical Psychology Review*, 16(6), 479-496, 1996.

Answers A & B: The use of these two therapies conjointly has been found more effective than either therapy alone.

Answer C: Administering these treatments conjointly has been found to be more effective regardless of the occurrence of nicotine tolerance.

Question 25

Not answered

Marked out of 1.00

Question ID #13352: In the context of test validity, specificity refers to which of the following?

Select one:

- ☐ A. The correct identification of true negatives
- ☐ B. The correct identification of true positives
- ☐ C. The correct identification of true negatives and true positives
- ☐ D. The correct identification of false negatives and false positives

The correct answer is A.

Specificity refers to the correct identification of true negatives—i.e., the percent of cases in the validation sample who do not have the characteristic being screened for and were accurately identified by the predictor as not having that characteristic.

Answer B: Sensitivity refers to the correct identification of true positives.

Answers C & D are incorrect.

Question 26

Not answered

Marked out of 1.00

Question ID #12597: Dr. Staret is renting Dr. Tyro office space and providing him with secretarial services, and he charges Dr. Tyro on a "per patient" basis. Dr. Tyro will be receiving occasional referrals from Dr. Staret. This arrangement is:

Select one:

- ☐ A. unethical because it represents "fee-splitting"
- ☐ B. unethical because it represents a "multiple relationship"
- ☐ C. ethical as long as the per patient fee is based on Dr. Staret's actual costs
- ☐ D. ethical as long as the per patient fee does not include a referral fee

The correct answer is C.

Although "fee-splitting" is not explicitly prohibited by the Ethics Code, certain restrictions apply when client fees will be shared. The per patient fee must reflect Dr. Staret's actual costs and can include any costs involved in making a referral.

Answer A: This scenario does not involve "fee-splitting" but rather Dr. Staret's actual costs. See explanation for response C.

Answer B: This scenario does not involve the issue of "multiple relationships." See explanation for response C.

Answer D: A referral fee is acceptable as long as it represents the costs involved in making the referral (e.g., the time Dr. Staret spends preparing a client's file or discussing the case with Dr. Tyro).

Question 27

Not answered

Marked out of 1.00

Question ID #13671: Habit reversal training includes training in all of the following areas except:

Select one:

- ☐ A. competing response
- ☐ B. motivation
- ☐ C. decompression
- ☐ D. generalization

The correct answer is C.

Habit reversal training incorporates awareness, relaxation, motivation, competing response, and generalization training. 'Decompression' training is not an actual training.

Answer A: Competing response training is incorporated into habit reversal training.

Answer B: Motivation training is also incorporated.

Answer D: Generalization training is incorporated into habit reversal training.

Question 28

Not answered

Marked out of 1.00

Question ID #13863: Phinney and Devich-Navarro's (1997) six categories of acculturation include:

Select one:

- ☐ A. assimilated, fused, blended bicultural, alternating bicultural, separated, and marginal
- ☐ B. assimilated, fused, bicultural, alternating multicultural, separated, and marginal
- ☐ C. assimilated, fused, bicultural, accommodated, separated, and marginal
- ☐ D. assimilated, fused, bicultural, alternating bicultural, separated, and marginal

The correct answer is A.

Phinney and Devich-Navarro (1997) proposed a model of acculturation that included six categories of acculturation: assimilated, fused, blended bicultural, alternating bicultural, separated, and marginal.

Answer B: Alternating multicultural is not one of the six categories.

Answer C: Accommodated is not one of the six categories.

Answer D: Blended bicultural is missing from this list, making it incorrect.

Question 29

Not answered

Marked out of 1.00

Question ID #13356: In the context of test validity, _____ is said to occur when a criterion-related validity coefficient is smaller in size for a cross-validation sample than it was for the initial sample.

Select one:

- ☐ A. criterion deficiency
- ☐ B. attenuation
- ☐ C. shrinkage
- ☐ D. criterion contamination

The correct answer is C.

The validity coefficient usually "shrinks" on cross-validation because the chance factors operating in the original sample are not all present in the cross-validation sample.

Answer A: Criterion deficiency refers to the degree to which an actual criterion fails to overlap with the conceptual criterion.

Answer B: In test construction, the correction for attenuation is used to estimate what a predictor's validity coefficient would be if the predictor and/or the criterion were perfectly reliable.

Answer D: Criterion contamination refers to the bias introduced into a person's criterion score as a result of the scorer's knowledge of the person's performance on the predictor.

Question 30

Marked out of 1.00

Question ID #13420: Which of the following is not a symptom of Dependent Personality Disorder?

Select one:

- ☐ A. Difficulty making decisions without advice or reassurance from others
- ☐ B. Fears disagreeing with others
- ☐ C. Views self as socially inept
- ☐ D. Goes to great lengths to gain nurturance from others

The correct answer is C.

Dependent Personality Disorder involves a pervasive need to be taken care of, which leads to submissive, clinging behavior, and fear of separation. All of the responses are symptoms of this disorder except for answer C. "Views self as socially inept" is a symptom of Avoidant Personality Disorder.

Answers A, B, and D: These are all symptoms of Dependent Personality Disorder.

Question 31

Not answered

Marked out of 1.00

Question ID #14410: A psychophysicist is measuring "just noticeable differences" while investigating the relationship between changes in the intensity of light and her research participants' perceptions of those changes. The measuring scale being used has

Select one:

- ☐ A. psychologically equal intervals.
- ☐ B. physically equal intervals.
- ☐ C. psychologically and physically equal intervals.
- ☐ D. psychologically and physically unequal intervals.

The correct answer is A.

Psychophysics is the study of the relationship between stimulus magnitude and perception of that stimulus. Psychophysicists use just noticeable differences (JNDs) and similar measurements to study the relationship between changes in physical stimuli and the psychological responses to those changes. JNDs are considered to be equal; however, the corresponding physical stimuli are not. For example, it may take only the addition of one pound to notice a difference when you start with ten pounds but the addition of ten pounds to notice a difference when you start with 100 pounds. In each case, the JND is equal to one, but the physical differences in weight are not the same.

Answer B: JNDs represent psychologically equal intervals, not physically equal intervals.

Answer C: JNDs represent psychologically equal intervals while their corresponding physical differences do not.

Answer D: JNDs represent psychologically equal (not unequal) intervals.

Question 32

Not answered

Marked out of 1.00

Question ID #11113: Taking away a child's video game system when she has a tantrum in order to decrease the tantrums is an example of which of the following?

Select one:

- ☐ A. Positive punishment
- ☐ B. Negative punishment
- ☐ C. Negative reinforcement
- ☐ D. Positive reinforcement

The correct answer is B.

The question states that the purpose of the conditioning is to decrease the target behavior, so punishment is the correct answer. Negative punishment occurs when a behavior decreases due to removal or cessation of a stimulus following the behavior. The removal of the video game system (stimulus) after the girl's tantrum (target behavior) in order to decrease the behavior is an example of negative punishment (as something is being taken away).

Answer A: Positive punishment occurs when a behavior decreases because of the application of a stimulus following the behavior.

Answer C: With negative reinforcement, a behavior increases as the result of the withdrawal or termination of a stimulus following the behavior.

Answer D: Positive reinforcement occurs when a behavior increases because of the stimulus that is applied (or added) following the behavior.

Question 33

Not answered

Marked out of 1.00

Question ID #10611: Tokens in a token economy act as which of the following?

Select one:

- ☐ A. Primary reinforcers
- ☐ B. Back-up reinforcers
- ☐ C. Generalized conditioned reinforcers
- ☐ D. Generalized unconditioned reinforcers

The correct answer is C.

In a token economy, tokens have value because they can be exchanged for a variety of unconditioned (primary) reinforcers. Tokens are generalized conditioned (secondary) reinforcers that can be exchanged for a variety of unconditioned (primary) reinforcers. Like other conditioned reinforcers, they are reinforcing only because they are associated with primary reinforcers.

Answer A: Primary reinforcers are inherently reinforcing and include food, water, and desirable activities.

Answer B: In a token economy, the back-up reinforcers are the primary reinforcers that can be "purchased" with tokens.

Answer D: This is a distractor, as the term for a primary reinforcer is an unconditioned reinforcer (not a generalized unconditioned reinforcer).

Question 34

Not answered

Marked out of 1.00

Question ID #12907: A researcher uses the chi-square test to determine if the ethnic/racial make-up (i.e., White, Black/African-American, Latino/Hispanic, Asian, Other) of a particular community on the West Coast differs significantly from a similar-sized community on the East Coast. Ten years later, the researcher returns to the West Coast community and finds that it has not changed dramatically in size but has changed in terms of racial and ethnic group membership. The researcher now wants to determine if the West Coast community's current ethnic/racial make-up differs significantly from the make-up observed in that community ten years earlier and plans to compare the number of individuals in each ethnic/racial category for the two years (2010 and 2020). The researcher cannot use a chi-square test to analyze the data for the current study because_____.

Select one:

- ☐ A. the study now includes two independent variables
- ☐ B. the data violate the assumption of independence
- ☐ C. the data violate the assumption of random assignment
- ☐ D. the data violate the assumptions of independence and random assignment

The correct answer is B.

The use of any statistical test requires that the data are measured on a particular scale and that certain assumptions are met. An assumption for the chi-square test is that observations are independent, which means that each individual can appear in only one category. In this study, people who lived in the community in both 2010 and 2020 would appear in two categories, which would violate this assumption.

Answer A: A multiple-sample chi-square test can be used when a study includes two or more independent variables.

Answer C: Random assignment is not an assumption for the chi-square test.

Answer D: The data does violate the assumption of independence, but random assignment is not an assumption for the chi-square test.

Question 35

Not answered

Marked out of 1.00

Question ID #13287: Hypocretin is a hormone involved in the regulation of sleep. A deficiency of this hormone is associated with which of the following diagnoses?

Select one:

- ☐ A. Rapid Eye Movement Sleep Behavior Disorder
- ☐ B. Non-Rapid Eye Movement Sleep Arousal Disorder
- ☐ C. Insomnia Disorder
- ☐ D. Narcolepsy

The correct answer is D.

A deficiency of hypocretin is a potential symptom of Narcolepsy. For a diagnosis of Narcolepsy, the individual must experience cataplexy (a brief loss of muscle tone), a deficiency of hypocretin, or a rapid eye movement latency that is less than or equal to 15 minutes.

Answers A, B, and C: These responses are incorrect as hypocretin is associated with a diagnosis of Narcolepsy.

Question 36

Not answered

Marked out of 1.00

Question ID #12912: Which of the following would determine whether you should conduct a one- or two-tailed test?

Select one:

- ☐ A. Alpha
- ☐ B. Power
- ☐ C. The null hypothesis
- ☐ D. The alternative hypothesis

The correct answer is D.

The alternative hypothesis states the opposite of the null hypothesis and is expressed in a way that implies that the independent variable does have an effect. When the alternative hypothesis is nondirectional, you would use a two-tailed test. When the alternative hypothesis is directional, you would use a one-tailed test.

Answer A: Alpha is used to define the size of the rejection region. When a two-tailed test is used, the rejection region is equally divided between the two tails of the sampling distribution. However, you do not use alpha to determine which tailed test to use.

Answer B: A one-tailed test is more powerful than a two-tailed test when used appropriately, but power is not used to determine whether a one- or two-tailed test should be conducted.

Answer C: The null hypothesis is stated in a way that implies that the independent variable does not have an effect on the dependent variable. It is not used to determine which tailed test to use.

Question 37

Not answered

Marked out of 1.00

Question ID #13856: From the perspective of ego psychology, the "ego autonomous" functions:

Select one:

- ☐ A. are conflict-free.
- ☐ B. are involved in the resolution of conflicts.
- ☐ C. are similar to defense mechanisms.
- ☐ D. are not under the control of the individual.

The correct answer is A.

The ego-analysts emphasize the impact of the ego on personality development and distinguish between two ego functions: the ego defensive functions and the ego autonomous functions. The ego autonomous functions represent the "conflict free ego sphere." They include positive, integrative, and reality-oriented ego functions, such as speech, learning, memory, perception, and decision-making.

Answers B and C: The ego defensive functions are similar to those described by Freud (the defense mechanisms), and are involved in the resolution of conflicts.

Answer D: For the ego analysts, healthy behavior is under the conscious control of the ego. Pathology may develop when the "ego loses its autonomy from the id or from reality [and] behavior is no longer under conscious control" (Wolberg, 1988, p. 253).

Question 38

Not answered

Marked out of 1.00

Question ID #14411: In most people, the left hemisphere is dominant for which of the following functions?

Select one:

- ☐ A. perceiving whole shapes from parts
- ☐ B. recognizing emotions in facial expressions
- ☐ C. controlling complex and precise movements
- ☐ D. perceiving direction and distance

The correct answer is C.

In the majority of people, the left hemisphere is dominant for fine motor functioning, which is evident in the fact that most people are right-handed. Knowing that the right (nondominant) hemisphere is responsible for processing emotional and spatial information would have helped eliminate incorrect answers.

Answer A: The right hemisphere is responsible for understanding part-whole relationships; for example, recognizing familiar objects from incomplete pictorial data and perceiving whole shapes from parts.

Answer B: The right hemisphere is also responsible for decoding emotion in facial expressions and language.

Answer D: The right hemisphere predominates in the perception of depth, distance, direction, and orientation.

Question 39

Marked out of 1.00

Question ID #12104: Sia accidentally trimmed her bangs a little too short. The night before school, she yells at her mother that, "everyone will stare at me and we need to go to the salon tonight or I'm not going to school!" According to Elkind, Sia's belief is an example of what developmental concept in adolescence?

Select one:

- ☐ A. Personal fable
- ☐ B. Uniqueness and the vulnerability aspect
- ☐ C. Imaginary audience
- ☐ D. Delusional egocentrism

The correct answer is C.

The imaginary audience is the belief that one is always the center of attention or that all eyes are on them.

Answer A: The personal fable is the belief that one is special and unique, so much so that no one can understand what the adolescent is going through or that they are so special that the rules don't apply to them or they won't incur the same consequences as others.

Answer B: Two sub-sets or characteristics of the personal fable are the invulnerability aspect, not the vulnerability aspect and feelings of uniqueness.

Answer D: While egocentrism is at the core of the personal fable and the imaginary audience and it may appear that adolescents hold these beliefs with delusional intensity, delusional egocentrism isn't a concept posited by David Elkind.

Question 40

Marked out of 1.00

Question ID #10444: Spontaneous recovery is associated with which of the following?

Select one:

- ☐ A. Higher-order conditioning
- ☐ B. Stimulus discrimination
- ☐ C. Extinction
- ☐ D. Overshadowing

The correct answer is C.

Spontaneous recovery occurs when an extinguished conditioned response recurs without additional conditioning trials. Pavlov found that following extinction trials, dogs in his studies often spontaneously emitted the conditioned response (CR) and he referred to this as spontaneous recovery. Spontaneous recovery is the reason why it is often necessary to conduct multiple extinction sessions in order to eliminate a conditioned response.

Answer A: Higher-order conditioning is a procedure where a conditioned stimulus (CS) of one experiment acts as the unconditioned stimulus (US) of another to condition a neutral stimulus.

Answer B: Stimulus discrimination refers to an organism's ability to respond to a specific stimulus with a conditioned response, but not to similar stimuli.

Answer D: Overshadowing occurs when only one of two neutral stimuli that have been simultaneously paired with an US elicits a CR when presented separately. The stimulus that is more salient to the subject will produce a CR.

Question 41

Not answered

Marked out of 1.00

Question ID #13592: The diagnosis of Somatic Symptom Disorder requires which of the following?

Select one:

- ☐ A. The presence of one or more somatic symptoms
- ☐ B. Persistent and disproportionate thoughts about the seriousness of the symptoms
- ☐ C. Persistently high level of anxiety about one's health or symptoms
- ☐ D. Excessive time and energy devoted to health concerns or symptoms

The correct answer is A.

The essential feature of Somatic Symptom Disorder is the presence of one or more somatic symptoms that cause distress. Of the symptoms listed this is the only requirement for the diagnosis.

Answers B, C, and D: These responses are incorrect as they are all possible symptoms of Somatic Symptom Disorder, but not required. For this diagnosis, an individual must meet criteria for at least one (but not all) of the symptoms listed in these responses.

Question 42

Marked out of 1.00

Question ID #14402: A brief period of electrical stimulation of the hippocampus enhances nerve cell electrical activity in that area of the brain for minutes to hours. This is referred to as :

Select one:

- ☐ A. graded potentiation.
- ☐ B. hyperpolarization.
- ☐ C. long-term potentiation.
- ☐ D. absolute refractory period.

The correct answer is C.

Long-term potentiation (LTP) refers to the greater responsivity of a postsynaptic neuron to low-intensity stimulation by a presynaptic neuron for hours, days, or even weeks after the presynaptic neuron has been barraged by high-frequency stimulation. Interestingly, this phenomenon not only occurs in the living brain but can also be induced in cells that have been removed from the brain. LTP is believed to underlie certain types of learning and memory.

Answer A: This is a distractor option, as "graded potentiation" is a made-up term.

Answer B: Hyperpolarization refers to a state of inhibition.

Answer D: During the absolute refractory period, a cell cannot "fire" regardless of the amount of stimulation.

Question 43

Marked out of 1.00

Question ID #10662: Dr. Garland has been working with a client, Patricia, for six months. Patricia initially began treatment with Dr. Garland for help in coping with a breakup with her significant other. Patricia is doing well and does not appear to be gaining additional benefits from therapy. What is Dr. Garland's ethical responsibility in this case?

Select one:

- ☐ A. Dr. Garland should continue providing services to Patricia until she voices she is ready to terminate.
- ☐ B. Dr. Garland should point out other problematic areas Patricia should examine in their therapy.
- ☐ C. Dr. Garland should move toward termination with Patricia.
- ☐ D. The Ethics Code does not address this issue directly, but psychologists should examine the General Guidelines for Providers of Psychological Services for help in making a decision.

The correct answer is C.

Standard 10.10 requires psychologists to "terminate therapy when it becomes reasonably clear that the client/patient no longer needs the service, is not likely to benefit or is being harmed by continued service."

Answer A: In the event that it is "reasonably clear" a client is not benefiting from further treatment, a psychologist should move toward termination.

Answer B: If the client is doing well, and seems to have resolved their concerns, the Ethics Code advises psychologists to move toward termination rather than looking for additional concerns that might come under the purview of treatment.

Answer D: This answer is incorrect. The Ethics Code provides clear guidance on this issue.

Question 44

Not answered

Marked out of 1.00

Question ID #14398: For a genetic male fetus to develop male genitalia, the fetus must be stimulated by _____ during the critical period of development which, in humans, appears to be during the middle third of pregnancy.

Select one:

- ☐ A. progesterone
- ☐ B. estrogen
- ☐ C. androgen
- ☐ D. estradiol

The correct answer is C.

Androgens are a group of hormones that play a role in male traits and reproductive activity. The principal androgens are testosterone and androstenedione.

Answer A: Progesterone is a female sex hormone that is produced in the ovaries following ovulation each month. It plays a critical role in the menstrual cycle and the maintenance of pregnancy.

Answer B: Estrogen are hormones that are important for sexual and reproductive development, mainly in women. Estrogen helps develop and maintain both the reproduction system and female characteristics in addition to contributing to cognitive health, bone health, and aiding in the function of the cardiovascular system.

Answer D: Estradiol's main function is to mature and then maintain the reproductive system. During the menstrual cycle, increased estradiol levels cause the maturation and release of the egg, as well as the thickening of the uterus lining to allow a fertilized egg to implant.

Question 45

Not answered

Marked out of 1.00

Question ID #12846: Which item is not a factor associated with cognitive decline in later adulthood?

Select one:

- ☐ A. Nutrition
- ☐ B. Physical health
- ☐ C. Disuse
- ☐ D. Declining processing speed

The correct answer is A.

Researchers have identified several factors that are associated with cognitive decline in later adulthood, including declining processing speed, physical health, and disuse. While nutrition may significantly influence, physical health, it does not directly impact cognitive decline. Thus, nutrition is not the best answer.

Answer B: Physical health is a factor influential in cognitive decline in later adulthood. One health factor that is particularly important is cardiovascular functioning, which has an impact on information processing speed and other cognitive functions.

Answer C: Researchers have proposed that, at least for some older adults, declines in cognitive ability are due to disuse and are therefore, reversible with relatively simple training and practice.

Answer D: Declining processing speed is a factor influential in the presentation of cognitive decline in later adulthood. Many items and tasks included in cognitive ability tests emphasize speed of information processing, and, consequently, observed age-related declines on those tests may be due to the fact that people over 50 experience a decline in the efficiency and speed with which they manipulate information. Older examinees typically do better when they are given as much time as they need to complete cognitive tasks.

Question 46

Not answered

Marked out of 1.00

Question ID #10663: Dr. French would like to have 6th grade students in a local middle school complete a survey related to her research. Dr. French needs to _____.

Select one:

- ☐ A. obtain informed consent from the students
- ☐ B. obtain informed consent from the school administrators
- ☐ C. obtain assent from the students
- ☐ D. obtain assent from the students' parents

The correct answer is C.

Standard 3.10 notes that when psychologists conduct research they obtain informed consent. However, "for persons who are legally incapable of giving informed consent, psychologists...seek the individual's assent...and obtain appropriate permission from a legally authorized person." In this case, students can provide assent, and parents should provide consent or permission for their child to participate.

Answer A: Because the students are not legally authorized to consent, they may provide their assent.

Answer B: School personnel are not legally authorized to provide permission on the students' behalf.

Answer D: This answer is incorrect, because while parents need to provide permission for their children to participate, the term "assent" refers specifically to the actions of individuals who are legally incapable for giving informed consent.

Question 47

Not answered

Marked out of 1.00

Question ID #13741: Based on their review of the research on eye movement desensitization and reprocessing (EMDR), Davidson and Parker (2001) concluded that eye movements:

Select one:

- ☐ A. are the most important contributor to the effectiveness of the treatment
- ☐ B. are one of three essential contributors to the effectiveness of the treatment
- ☐ C. are not an essential contributor to the effectiveness of the treatment
- ☐ D. actually decrease the effectiveness of the treatment

The correct answer is C.

The research on EMDR has not produced entirely consistent results. However, Davidson and Parker's (2001) meta-analysis found that eye movements do not contribute to its effectiveness and that its benefits are due, instead, to exposure to the feared stimulus. These investigators concluded that the treatment has similar effects with and without the inclusion of eye movements.

Answer A: The answer, "are the most important contributor to the effectiveness of the treatment", is incorrect. See explanation for response C.

Answer B: The answer, "are one of three essential contributors to the effectiveness of the treatment", is incorrect. See explanation for response C.

Answer D: The answer, "actually decrease the effectiveness of the treatment", is incorrect. See explanation for response C.

Question 48

Marked out of 1.00

Question ID #12992: A consultant is hired to help a teacher who has been working at an inner-city school for two years. The teacher feels she does not have the skills she needs to deal with ongoing race-related conflicts that she often encounters in her classroom. This is an example of:

Select one:

- ☐ A. client-centered case consultation
- ☐ B. consultee-centered case consultation
- ☐ C. program-centered administrative consultation
- ☐ D. consultee-centered administrative consultation

The correct answer is B.

In this situation, the consultant's goal is to help the teacher acquire the skills she needs to deal with ongoing problems in her classroom. In consultee-centered case consultation, the focus is on the consultee's skills, abilities, objectivity, etc.

Answer A: In client-centered case consultation, there would be a particular student who would be the focus of the consultation.

Answer C: In program-centered administrative consultation, an existing program is the focus.

Answer D: In this type of consultation, the consultant helps administrators acquire the skills they need for future program development and implementation.

Question 49

Not answered

Marked out of 1.00

Question ID #14401: The inability to repeat what one has just heard and to name familiar objects without a loss of comprehension is characteristic of which of the following?

Select one:

- ☐ A. anomic aphasia
- ☐ B. conduction aphasia
- ☐ C. Broca's aphasia
- ☐ D. Wernicke's aphasia

The correct answer is B.

The aphasias all involve a disruption in language. Conduction aphasia is the result of damage to the arcuate fasciculus, which connects Broca's and Wernicke's areas. This disorder is characterized by anomia, paraphasia, and impaired repetition.

Answer A: Anomic aphasia is characterized by difficulty with naming objects when speaking and writing.

Answer C: Broca's aphasia is characterized by difficulties with producing written and spoken language.

Answer D: Wernicke's aphasia is characterized by difficulty understanding written and spoken language and generating meaningful language.

Question 50

Not answered

Marked out of 1.00

Question ID #10730: Dr. Wallace's new client tells him she had a sexual relationship with her former therapist. Dr. Wallace should _____.

Select one:

- ☐ A. attempt to resolve the issue with the previous therapist
- ☐ B. attempt to resolve the issue with the previous therapist if he can do so without violating the client's confidentiality
- ☐ C. formally report the ethics violation
- ☐ D. formally report the ethics violation, without violating the client's confidentiality

The correct answer is D.

While the APA's Ethics Code encourages psychologists to resolve ethical violations informally, when "informal resolution appears appropriate," when the violation involves "substantial harm" and is not appropriate for an informal resolution, filing an official complaint is warranted. Sexual misconduct is an offense that involves "substantial harm." Importantly, client confidentiality takes precedence over the need to educate or punish an offending psychologist.

Answer A: This answer is incorrect, because sexual misconduct is considered an offense that involves "substantial harm."

Answer B: Even though this answer acknowledges the need to protect client confidentiality, it is incorrect because of the severity of the offense.

Answer C: This answer is incorrect, because it fails to account for the need to protect the client's confidentiality.

Question 51

Not answered

Marked out of 1.00

Question ID #12129: Sexual harassment _____.

Select one:

- ☐ A. is explicitly prohibited by ethical guidelines
- ☐ B. is not explicitly prohibited by ethical guidelines but is implicitly prohibited by standards limiting multiple relationships
- ☐ C. is not explicitly prohibited by ethical guidelines but is implicitly prohibited by standards limiting sexual intimacies
- ☐ D. is not explicitly prohibited by ethical guidelines but is implicitly prohibited by standards requiring avoidance of harm

The correct answer is A.

Sexual harassment is explicitly addressed by Standard 3.02 of the APA's Ethics Code and Principle I.4 of the Canadian Code of Ethics. Standard 3.02 of the Ethics Code states that "psychologists do not engage in sexual harassment"; and Principle I.4 of the Canadian Code of Ethics states that psychologists "abstain from all forms of harassment, including sexual harassment."

Answer B: This answer is incorrect. Sexual harassment is explicitly addressed in the codes.

Answer C: This answer is incorrect as sexual harassment is explicitly prohibited in the ethics codes.

Answer D: This answer is incorrect. The ethics codes prohibit sexual harassment explicitly.

Question 52

Not answered

Marked out of 1.00

Question ID #13556: Individuals who are diagnosed with Bulimia Nervosa:

Select one:

- ☐ A. ordinarily maintain their body weight at or below a minimally normal weight for height and age
- ☐ B. ordinarily lose weight due to recurrent compensatory behaviors such as self-induced vomiting
- ☐ C. ordinarily maintain their body weight at or above a minimally normal weight for height and age
- ☐ D. ordinarily gain weight due to recurrent episodes of binge eating

The correct answer is C.

Bulimia Nervosa involves recurrent episodes of binge eating, with a sense of lack of control over eating; recurrent compensatory behaviors to prevent weight gain; and self-evaluation that is overly influenced by body weight and shape. Individuals who are diagnosed with Bulimia ordinarily maintain their body weight at or above a minimally normal weight for height and age.

Answers A, B, and D: These responses are incorrect as individuals who are diagnosed with Bulimia typically maintain a weight at or above the minimally normal weight for height and age.

Question 53

Not answered

Marked out of 1.00

Question ID #13490: For a diagnosis of Cyclothymic Disorder, symptoms must include:

Select one:

- ☐ A. at least one hypomanic episode
- ☐ B. multiple major depressive episodes
- ☐ C. multiple periods of hypomanic symptoms that do not meet the criteria for a hypomanic episode
- ☐ D. multiple periods of manic symptoms that do not meet the criteria for a manic episode

The correct answer is C.

Cyclothymic Disorder is characterized by multiple periods of hypomanic symptoms that do not meet the criteria for a hypomanic episode and multiple episodes of depressive symptoms that do not meet the criteria for a major depressive episode. Symptoms must last for at least two years in adults and one year in children and adolescents.

Answers A, B, and D: These responses are incorrect as they are not accurate requirements for a diagnosis of Cyclothymic Disorder. The diagnosis requires hypomanic symptoms that do not meet the criteria for a hypomanic episode and depressive symptoms that do not meet the criteria for a major depressive episode.

Question 54

Not answered

Marked out of 1.00

Question ID #13472: During an episode of depersonalization:

Select one:

- ☐ A. the individual lacks insight and experiences a sense of unreality regarding one's surroundings
- ☐ B. the individual lacks insight and is preoccupied with having multiple personalities
- ☐ C. reality testing remains intact and symptoms cause impairment in functioning
- ☐ D. the individual cannot recall important autobiographical information

The correct answer is C.

Depersonalization/Derealization Disorder involves recurrent or persistent episodes of depersonalization or derealization. Depersonalization involves a sense of unreality, detachment, or being an outside observer of one's thoughts, feelings, and actions. Reality testing remains intact during episodes, and symptoms cause significant distress or impaired functioning.

Answer A: The experience of unreality regarding one's surroundings describes derealization. However, reality testing remains intact during these episodes.

Answer B: This response does not describe depersonalization.

Answer D: The inability to recall important autobiographical information is consistent with a diagnosis of Dissociative Amnesia.

Question 55

Not answered

Marked out of 1.00

Question ID #12870: According to social judgment theory, the degree of persuasion a message produces is likely to be higher when the message:

Select one:

- ☐ A. expresses a position that is totally acceptable to the target person
- ☐ B. expresses a position that is clearly objectionable to the target person
- ☐ C. expresses a position that is neither clearly acceptable nor clearly objectionable to the target person
- ☐ D. expresses a position that is mildly acceptable to the target person

The correct answer is C.

According to social judgment theory, a message is likely to be more persuasive when it expresses a position neither clearly acceptable nor clearly objectionable to the target person.

Answers A, B, and D: The message will be more persuasive when it declares a position neither totally acceptable nor totally objectionable to the target person.

Question 56

Question ID #13665: Habit reversal training was originally developed to treat:

Select one:

- ☐ A. obsessions and compulsions
- ☐ B. nervous habits and motor tics
- ☐ C. Childhood-Onset Fluency Disorder
- ☐ D. Tourette's syndrome

The correct answer is B.

Habit reversal training was originally designed as a treatment for nervous habits and motor tics. It has since been applied to the treatment of a number of other symptoms including stuttering.

Answer A: This is not true.

Answer C: While habit reversal training is now used as a treatment for this disorder, especially among older children and adults who suffer from stuttering, it was not originally developed specifically to treat this disorder.

Answer D: Habit reversal training was not originally developed as a treatment for this specific disorder alone.

Question 57

Marked out of 1.00

Question ID #10549: Dr. Winters is a clinical psychologist with a private practice who is hired by a university to teach a graduate course. In terms of her ethical obligation, Dr. Winters is required to do which of the following?

Select one:

- ☐ A. Ensure that there are multiple means by which to evaluate students
- ☐ B. Ensure that the course content reflects the most recent research in the area
- ☐ C. Ensure that accurate information about the course is available to all interested parties
- ☐ D. Ensure that the seminar content is consistent with the interests and needs of the students

The correct answer is C.

Ethical Standard 7.02 of the Ethics Code addresses this issue. It states, "Psychologists...take reasonable steps to ensure that there is a current and accurate description of the program content...training goals and objectives, stipends and benefits, and requirements that must be met for satisfactory completion...."

Answer A: This answer is incorrect. While this is generally a good idea, it is not explicitly required by the Code.

Answer B: This answer is incorrect as there would be times when it would not apply, such as when the seminar is covering the history of psychology.

Answer D: This answer is incorrect. Although student interests and needs are a consideration when defining course content, they are not the only consideration, and this action is not explicitly required by the Code.

Question 58

Marked out of 1.00

Question ID #10731: Dr. Smith's state licensing board contacts her to prove that she has obtained her annual continuing education hours. Because Dr. Smith has moved, she does not receive their letters. The state licensing board files an ethics complaint with APA. If Dr. Smith does not respond to APA's Ethics Committee, she is _____.

Select one:

- ☐ A. in violation of the law
- ☐ B. in violation of her ethical responsibility
- ☐ C. in violation of both the law and her ethical responsibility
- ☐ D. in violation of neither the law nor her ethical responsibility provided she completed her required continuing education hours

The correct answer is B.

Standard 1.06 states "Psychologists cooperate in ethics investigations, proceedings, and resulting requirements of the APA or any affiliated state psychological association to which they belong....Failure to cooperate is itself an ethics violation."

Answer A: If Dr. Smith does not respond to APA's Ethics Committee inquiry, she is in violation of her ethical responsibility rather than a legal responsibility.

Answer C: This answer is incorrect. The question is asking about Dr. Smith's failure to respond to APA's Ethics Board. This is an ethical problem, rather than a legal one.

Answer D: This answer is incorrect. The central concern of this question has to do with Dr. Smith's responding to the APA Ethical Committee's inquiry. Psychologists are required to respond per Standard 1.06.

Question 59

Not answered

Marked out of 1.00

Question ID #10775: Dr. Freeman works for a community mental health center that requires her to see 8 clients each day. Dr. Freeman believes this heavy case load compromises her ability to focus on her clients and to meet their needs. Dr. Freeman should _____.

Select one:

- ☐ A. file an ethics complaint against her employer with APA
- ☐ B. file an ethics complaint against her employer with the state licensing board
- ☐ C. make known her commitment to the Ethics Code
- ☐ D. strive to do her best clinical work in spite of the challenging demands of the job

The correct answer is C.

Standard 1.03 states "If the demands of an organization with which psychologists are affiliated or for whom they are working are in conflict with the Ethics Code, psychologists clarify the nature of the conflict, make known their commitment to the Ethics Code, and take reasonable steps to resolve the conflict...."

Answer A: Unless the administrator is a member of APA, the Ethics Committee will not act on the complaint. Even if her supervisor is a member, however, Dr. Freeman should take other steps first to attempt to resolve the issue.

Answer B: If the administrator is a licensed professional, it is possible the board may hear the complaint, but again, it would be better for Dr. Freeman to take some initial steps first.

Answer D: This answer fails to account for the fact that psychologists have a responsibility to confront policies that are in conflict with their ethical responsibilities.

Question 60

Not answered

Marked out of 1.00

Question ID #12882: The belief that you knew all along which team was going to win a baseball game once the game is over, is known as:

Select one:

- ☐ A. extrasensory perception
- ☐ B. hindsight bias
- ☐ C. inflated ego
- ☐ D. hopeful

The correct answer is B.

Hindsight bias refers to the tendency to see events as more predictable than they are; "I knew it all along."

Answers A, C, and D: These answers do not accurately describe the scenario in the question. It is best described by the hindsight bias.

Question 61

Not answered

Marked out of 1.00

Question ID #12049: Luke's parents are uninvolved in his life. His mother left when Luke was young and his father doesn't pay much attention to him. Luke comes and goes as he pleases and he gets the sense that he doesn't matter very much. Which of Diana Baumrind's style of parenting is Luke most likely experiencing?

Select one:

- ☐ A. Permissive
- ☐ B. Authoritarian
- ☐ C. Authoritative
- ☐ D. Neglectful

The correct answer is D.

Rejecting-neglecting (uninvolved) parents exhibit low levels of responsivity and demandingness, and they may be overtly hostile toward their children. The characteristics of rejecting-neglecting parents resemble those predictive of juvenile delinquency.

Answer A: Permissive (indulgent) parents are warm and caring but make few demands and are nonpunitive. They allow their children to make their own decisions about what chores to complete, when to go to bed, etc.

Answer B: Authoritarian parents exhibit a high degree of demandingness and low responsivity. They impose absolute standards of conduct, stress obedience, and use physical punishment, threats, deprivation, and other power assertive techniques to gain compliance.

Answer C: Authoritative parents combine rational control with responsivity. Although they set clear rules and high standards for their children, they rely on reasoning, praise, explanations, and other inductive techniques to gain compliance, and they encourage independence.

Question 62

Not answered

Marked out of 1.00

Question ID #10778: Dr. Godfrey is currently divorcing her husband. The proceedings have been stressful while she has been managing a full client load. Dr. Godfrey should _____.

Select one:

- ☐ A. refer her clients to other practitioners until her divorce is resolved
- ☐ B. secure a different job that is less demanding of her personal resources
- ☐ C. seek consultation and possibly cut back on her practice
- ☐ D. explain her situation to her clients and let them decide what they want to do

The correct answer is C.

This answer closely aligns with Standard 2.06 which states, "When psychologists become aware of personal problems that may interfere with their performing work-related duties adequately, they take appropriate measures, such as obtaining professional consultation or assistance, and determine whether they should limit, suspend, or terminate their work-related duties."

Answer A: Dr. Godfrey might decide to refer some or even all of her clients, but this would not be her first course of action.

Answer B: Again, Dr. Godfrey may ultimately decide to find another job, but this answer does not track well with the APA's Ethics Code.

Answer D: This answer is incorrect. Dr. Godfrey has a professional responsibility to decide what is in the best interest of her clients in terms of their treatment.

Question 63

Not answered

Marked out of 1.00

Question ID #13896: Your colleague plans to use the "dismantling strategy" to identify the components of systematic desensitization that contribute most to its effectiveness. Being familiar with previous research using this strategy, you predict that she will find which of the following to be the critical component?

Select one:

- ☐ A. Reciprocal inhibition
- ☐ B. Negative reinforcement
- ☐ C. Classical extinction
- ☐ D. Escape conditioning

The correct answer is C.

Although Wolpe originally developed systematic desensitization as an application of reciprocal inhibition, research using the dismantling strategy has found that reciprocal inhibition is not the critical component. The dismantling strategy involves comparing the effects of the various components of an intervention by administering different components to different participants. The use of this strategy to identify the effective components of systematic desensitization has found that the critical component is extinction of the anxiety response through repeated exposure to the CS without the US.

Answer A: Reciprocal inhibition is a form of counterconditioning used to replace an undesired response with a desired response.

Answer B: Negative reinforcement occurs when a response increases because an aversive stimulus is removed following the response.

Answer D: Escape conditioning is a type of negative reinforcement in which a behavior occurs because it allows the individual to escape an undesirable stimulus or event.

Question 64

Not answered

Marked out of 1.00

Question ID #13843: Bandura's social learning theory implies that, in organizational settings, a training program will be most effective when:

Select one:

- ☐ A. it provides immediate rewards for achieving goals
- ☐ B. trainees participate in defining the program's goals
- ☐ C. trainees possess prerequisite skills before training begins
- ☐ D. models are clearly and consistently reinforced for successful performance

The correct answer is C.

Bandura has provided guidelines for applying social learning theory to the workplace. (See, e.g., R. Wood and A. Bandura, Social cognitive theory of organizational management, Academy of Management Review, 13, 361-384, 1999). Bandura stresses the importance of (1) self-efficacy beliefs; (2) intrinsic motivation; (3) focusing on overt activities and behaviors; and (4) ensuring that people have prerequisite skills.

Answer A: Immediate rewards are not necessary.

Answer B: Bandura's theory does not suggest this.

Answer D: Bandura's research indicated that it is not always necessary for the model to be rewarded in order for an observer to imitate the model's behavior.

Question 65

Marked out of 1.00

Question ID #14399: Which type of headache involves excruciating, usually burning, non-throbbing pain that is located behind one eye but may also involve the face and temple?

Select one:

- ☐ A. tension headache
- ☐ B. sinus headache
- ☐ C. cluster headache
- ☐ D. migraine headache

The correct answer is C.

A cluster headache involves burning, non-throbbing pain that occurs in clusters (one or more a day) over a two or three month period.

Answer A: A tension headache is characterized by non-throbbing pain, usually on both sides of the head, at the back of the neck, and/or in the facial area. It often feels like a band of pressure or tightness around the head.

Answer B: Sinus headaches are experienced as tension or a throbbing ache. The pain is usually most severe first thing in the morning and is worsened by bending forward.

Answer D: A migraine headache is a severe, recurrent throbbing headache that usually affects one side of the head and is often accompanied by nausea, vomiting, and sensitivity to light, noise, and odors. The pain is made worse by bending forward, lifting, or making jarring motions.

Question 66

Not answered

Marked out of 1.00

Question ID #12003: A teacher gives 3rd and 4th grade children a lesson on algebra and provided a worksheet for them to practice what they learned. What is most likely to happen in this scenario?

Select one:

- ☐ A. They would be able to solve simple algebra problems with support.
- ☐ B. The 4th graders would be able to solve them with support, but the 3rd graders would lack the logical reasoning skills needed to solve the algebra problems.
- ☐ C. They would lack the hypothetical-deductive reasoning skills needed to solve the algebra problems.
- ☐ D. They would not be able to think concretely enough to solve the algebra problems.

The correct answer is C.

Solving algebra problems requires the ability to think abstractly, deductively reason, and engage in hypothetical thought processes, which are all skills developed in the formal operational stage in youth 11 years old and greater.

Answer A: Third and fourth graders are still in the concrete operational stage and would experience great difficulty with the abstract cognitive processes associated with algebra, even with support.

Answer B: Neither third nor fourth graders would be able to complete the worksheet as they are still in the concrete operational stage and lack the abstract thinking skills needed.

Answer D: The problem is that their thinking is too concrete rather than being able to think concretely enough. They would have difficulty with abstract reasoning and hypothetical situations.

Question 67

Not answered

Marked out of 1.00

Question ID #11016: Remembering to take medicine at night before going to bed is an example of which type of memory?

Select one:

- ☐ A. Prospective memory
- ☐ B. Reconstructive memory
- ☐ C. Retrospective memory
- ☐ D. Source memory

The correct answer is A.

Prospective memory refers to the ability to "remember to remember;" in other words, it refers to the ability to remember to do something in the future.

Answer B: Reconstructive memory is the process of recreating an experience or event that has only been partially stored in memory.

Answer C: Retrospective memory refers to memory content that is in the past.

Answer D: Source memory is the contextual information for where or how an individual came to know what that person remembers.

Question 68

Not answered

Marked out of 1.00

Question ID #14418: For the assessment of Huntington's disease, magnetic resonance imaging (MRI) is:

Select one:

- ☐ A. not useful because it is not sufficiently sensitive to detect the brain anomalies associated with this disorder.
- ☐ B. not useful because it provides information only on brain morphology, which is not helpful for assessing this disorder.
- ☐ C. useful for distinguishing between active and older inactive plaques in the periventricular regions.
- ☐ D. useful for detecting volume reduction in the basal ganglia, even in some asymptomatic individuals.

The correct answer is D.

Knowing that Huntington's disease is caused by abnormalities in the basal ganglia will help identify the correct answer to this question. Structural and functional brain imaging techniques have both been used to assess brain pathology related to Huntington's disease. There is evidence that MRI (a structural technique) can identify reduced volume in the basal ganglia among genetically at-risk individuals who have not yet exhibited overt symptoms of the disorder.

Answer A: An advantage of MRI is that it is very sensitive to anomalies and has better resolution than a CT scan.

Answer B: As noted, information about structure is useful in the diagnosis of Huntington's disease.

Answer C: Plaques in the periventricular regions are characteristic of multiple sclerosis, not Huntington's disease.

Question 69

Not answered

Marked out of 1.00

Question ID #14415: Damage to which structure of the brain disrupts the sleep-wake cycle and can cause a permanent coma-like state sleep?

Select one:

- ☐ A. basal ganglia
- ☐ B. thalamus
- ☐ C. reticular formation
- ☐ D. cingulate cortex

The correct answer is C.

The reticular formation plays a role in states of consciousness like alertness and sleep. This structure has some control over which sensory signals reach the cerebrum and conscious attention.

Answer A: The basal ganglia are involved in planning, organizing, and coordinating voluntary movement. Damage to the basal ganglia cells may cause problems controlling speech, movement, and posture.

Answer B: The thalamus is involved in motor activity, language, and memory. Damage to the thalamus can result in difficulty concentrating, difficulty sleeping, and problems processing sensory information.

Answer D: The cingulate cortex surrounds the corpus callosum and is involved in attention, emotion, and the perception and subjective experience of pain. Damage to this area may result in cognitive, emotional, and behavioral disorders.

Question 70

Not answered

Marked out of 1.00

Question ID #12871: A change in one's own behavior or beliefs in the direction of other people's is known as:

Select one:

- ☐ A. obedience
- ☐ B. conformity
- ☐ C. compliance
- ☐ D. modeling

The correct answer is B.

Conformity is simply a change in one's beliefs or behaviors in the direction of those of others.

Answers A, C, D: These are not correct terms for the definition provided in the question.

Question 71

Marked out of 1.00

Question ID #12843: When interpreting an examinee's performance on the Halstead-Reitan Neuropsychological Battery, an examiner would classify an examinee's overall functioning as _____ if they achieve a score of 0 to 0.2 on the Halstead Impairment Index.

Select one:

- ☐ A. superior
- ☐ B. limited
- ☐ C. severe
- ☐ D. normal

The correct answer is D.

The Halstead-Reitan (H-R) is used to detect the presence of brain damage and determine its severity and possible location in individuals ages 15 and older. Interpretation of an examinee's performance on the H-R involves considering performance on the individual tests as well as overall performance, which is summarized by calculating the Halstead Impairment Index (HII). The HII ranges in value from 0 to 1.0, with a score of 0 to 0.2 suggesting normal functioning, 0.3 to 0.4 mild impairment, 0.5 to 0.7 moderate impairment, and 0.8 to 1.0 severe impairment.

Answer A: The HII does not have a superior classification.

Answer B: The HII does not have a limited classification.

Answer C: The severe classification of the HII ranges from 0.8 to 1.0.

Question 72

Marked out of 1.00

Question ID #13191: Which of the following is not a symptom of Disinhibited Social Engagement Disorder?

Select one:

- ☐ A. Overly familiar behavior
- ☐ B. Minimal social and emotional responsiveness
- ☐ C. Willingness to go with an unfamiliar adult with minimal hesitation
- ☐ D. Absent checking with an adult caregiver

The correct answer is B.

Minimal social and emotional responsiveness to others is one of three symptoms of Reactive Attachment Disorder.

Answers A, C, and D: These responses are incorrect as these are all symptoms of Disinhibited Social Engagement Disorder.

Question 73

Not answered

Marked out of 1.00

Question ID #10448: To reduce or eliminate a child's tantrums, which of the following would probably be most effective?

Select one:

- ☐ A. Positive reinforcement
- ☐ B. Negative reinforcement
- ☐ C. Positive punishment
- ☐ D. Negative punishment

The correct answer is D.

In this situation, the goal is to eliminate a behavior. Therefore, punishment is the correct choice. If you have to choose between positive and negative punishment as an intervention, negative punishment is generally preferred. Negative punishment involves removing a stimulus following a behavior, and examples of negative punishment are time-out and response cost.

Answer A: Positive reinforcement involves applying a stimulus following a behavior in order to increase that behavior.

Answer B: Negative reinforcement involves removing a stimulus following a behavior in order to increase that behavior.

Answer C: Positive punishment could be used, but it may be considered objectionable for both ethical and practical reasons. Hitting a child, for example, is an example of positive punishment that may be unethical. In practice, positive punishment is not as effective as negative punishment.

Question 74

Not answered

Marked out of 1.00

Question ID #12873: _____goals allow for opposing sides to work toward a common goal/cause

Select one:

- ☐ A. Superordinate
- ☐ B. Directed
- ☐ C. Graduated
- ☐ D. Tiered

The correct answer is A.

Superordinate goals are established in order to allow opposing sides to work toward a common goal, thus reducing hostilities.

Answers B, C, and D: These are not legitimate categories of goals.

Question 75

Not answered

Marked out of 1.00

Question ID #13574: Which of the following is not a subtype of Delusional Disorder?

Select one:

- ☐ A. Religious
- ☐ B. Persecutory
- ☐ C. Jealous
- ☐ D. Somatic

The correct answer is A.

Delusions are false beliefs that are maintained despite conflicting evidence. Subtypes of Delusional Disorder include erotomanic, grandiose, jealous, persecutory, somatic, mixed, and unspecified. The DSM-5 does not include a subtype for religious delusions.

Answers B, C, and D: These responses are incorrect as they are all subtypes of Delusional Disorder.

Question 76

Not answered

Marked out of 1.00

Question ID #13379: How does guessing affect a test's reliability coefficient?

Select one:

- ☐ A. As the probability of correctly guessing answers decreases, the reliability coefficient decreases.
- ☐ B. As the probability of correctly guessing answers increases, the reliability coefficient decreases.
- ☐ C. As the probability of correctly guessing answers increases, the reliability coefficient increases.
- ☐ D. Guessing does not affect a test's reliability coefficient.

The correct answer is B.

A test's reliability is affected by a number of factors including the likelihood that test items can be answered correctly by chance alone (guessing). The greater the likelihood that examinees can choose the correct answer by guessing, the lower the reliability.

Answer A: As the probability of correctly guessing answers decreases, the reliability coefficient increases (not decreases).

Answer C: As the probability of correctly guessing answers increases, the reliability coefficient decreases (not increases).

Answer D: Success on a test due to guessing diminishes the reliability of a test.

Question 77

Not answered

Marked out of 1.00

Question ID #13928: A mother and father bring in their 12-year-old son Josh to see a psychologist. They report to the psychologist that Josh is getting in trouble at school and disrespectful at home. When describing events to the psychologist, the mother and father interrupt one another and argue over the details discussed. The mother reports that Josh never completes his assigned chores and goes to his room as soon as he gets off the school bus each day. The father tells her that she is too hard on him and demands unrealistic expectations. A psychologist working from a structural family therapy perspective, would describe this problem as _____.

Select one:

- ☐ A. a stable coalition
- ☐ B. an unstable coalition
- ☐ C. detouring
- ☐ D. triangulation

The correct answer is C.

Detouring is a structural family therapy term used to describe when parents focus on a child either by overprotecting the child or, in this scenario, blaming/scapegoating him or her for the family's problems. Although the family presents with issues related to the son, it is evident that there are larger problems within other systems.

Answer A: Minuchin would describe a stable coalition as when a parent and child form a cross-generational coalition and consistently "gang up" against the other parent.

Answer B: Minuchin would say that an unstable coalition, also known as triangulation, occurs when each parent demands that the child side with him/her against the other parent.

Answer D: This is another way to describe the term "unstable coalition" as described in option C, however it does not describe the situation occurring in the scenario.

Question 78

Not answered

Marked out of 1.00

Question ID #13853: 'Alternating bicultural,' as defined by Phinney and Devich-Navarro, refers to:

Select one:

- ☐ A. having a distinct ethnic identity and a distinct American identity
- ☐ B. having two competing alternating ethnic identities
- ☐ C. having a strong integrated ethnic and American identity
- ☐ D. alternating between having an ethnic identity and no identity

The correct answer is A.

Phinney and Devich-Navarro (1997) distinguish between six categories of acculturation assimilated, fused, blended bicultural, alternating bicultural, separated, and marginal. The term alternating bicultural refers to having distinct ethnic and American identities.

Answer B: This does not define alternating bicultural.

Answer C: This describes blended bicultural.

Answer D: This does not define any of the six categories of acculturation defined by Phinney and Devich-Navarro.

Question 79

Not answered

Marked out of 1.00

Question ID #11708: According to Erikson, what must be established before adolescents can develop intimacy?

Select one:

- ☐ A. Intimacy
- ☐ B. Generativity
- ☐ C. Identity
- ☐ D. Ego integrity

The correct answer is C.

Erikson proposed that the primary developmental task of adolescence is the achievement of a coherent identity. Healthy identity development during adolescence is a precursor of intimacy in romantic relationships during emerging adulthood and lays the foundation for healthy adult relationships.

Answer A: Intimacy vs. isolation is in Erikson's 6th stage of development. The major conflict at this stage of life centers on forming intimate, loving relationships with other people. Success at this stage leads to fulfilling relationships. Struggling at this stage, on the other hand, can result in feelings of loneliness and isolation.

Answer B: Generativity is in Erikson's 7th stage of psychosocial development and is the positive goal of middle adulthood. This not only includes procreation but also of creativity and fulfilling one's full parental and social responsibilities toward the next generation. This is in contrast to narrow interest in the self, or self-absorption.

Answer D: Found in Erikson's 8th stage of psychosocial development, ego integrity vs. despair, the individual reflects on the life they lived and may develop either integrity (i.e., a sense of satisfaction in having lived a good life and the ability to approach death with equanimity) or despair (i.e., a feeling of bitterness about opportunities missed and time wasted, and a dread of approaching death).

Question 80

Not answered

Marked out of 1.00

Question ID #12911: When the results of the statistical test indicate that the obtained sample statistic is in the rejection region of the sampling distribution, the_____.

Select one:

- ☐ A. alternative hypothesis is rejected and the null hypothesis is retained
- ☐ B. obtained sample statistic was artificially inflated due to sampling error
- ☐ C. null hypothesis is rejected and the alternative hypothesis is retained
- ☐ D. incorrect statistical test was chosen

The correct answer is C.

When the results of an inferential statistical test indicate that the obtained sample value lies in the rejection region of the sampling distribution, the study's results are statistically significant; therefore, you would reject the null hypothesis and retain the alternative hypothesis.

Answer A: This is the opposite of what you should do. When the results of a study are statistically significant (the obtained sample value lies in the sampling distribution's rejection region), you would retain the alternative hypothesis and reject the null hypothesis.

Answer B: There is no evidence to suggest that the obtained sample statistic in the question was artificially inflated due to sampling error.

Answer D: There isn't enough information to suggest the use of an incorrect statistical test.

Question 81

Not answered

Marked out of 1.00

Question ID #13829: Recovery of cognitive ability following head trauma follows a predictable pattern in most patients. For example, with regard to disorientation, recovery usually occurs in which sequence?

Select one:

- ☐ A. Orientation to personal information, then to place, and finally to time
- ☐ B. Orientation to time and place followed by orientation to personal information
- ☐ C. Orientation to place, then to personal information, and finally to time
- ☐ D. Orientation to personal information, then to time, and finally to place

The correct answer is A.

Recovery of cognitive functions following head trauma usually follows a set pattern. For example, with regard to retrograde amnesia, the most remote memories return first. Orientation to personal information is recovered first, followed by place and then time. Patients who continue to be disoriented to personal information rarely exhibit orientation to time or place.

Answers B, C, & D: Recovery typically involves orientation to personal information, then to place, and finally to time.

Question 82

Not answered

Marked out of 1.00

Question ID #12877: Affect, behavior, and cognitions have been identified as the three components of:

Select one:

- ☐ A. attitudes
- ☐ B. biases
- ☐ C. personality
- ☐ D. bystander apathy

The correct answer is A.

Affect, behavior, and cognition are the three components of attitudes.

Answers B, C, and D: The three components listed best describe attitudes.

Question 83

Not answered

Marked out of 1.00

Question ID #12844: Which assessment was not standardized using the U.S. Census?

Select one:

- ☐ A. The Luria-Nebraska Neuropsychological Battery
- ☐ B. The Stanford-Binet Intelligence Scale, Fifth Edition
- ☐ C. The Minnesota Multiphasic Personality Inventory-2
- ☐ D. The Wechsler Adult Intelligence Scale, Fourth Edition

The correct answer is A.

The Luria-Nebraska Neuropsychological Battery was standardized using a sample of individuals with neurological impairment.

Answer B: Standardization of the Stanford-Binet Intelligence Scale, Fifth Edition was stratified to match the 2000 U.S. Census in terms of gender, ethnicity/culture, geographic region, and socioeconomic level.

Answer C: Standardization of the Minnesota Multiphasic Personality Inventory-2 approximated the 1980 U. S. Census in terms of age, gender, race/ethnicity, and social class.

Answer D: Standardization of the Wechsler Adult Intelligence Scale, Fourth Edition was stratified to match 2005 U.S. Census data in terms of age, gender, race/ethnicity, geographic region, and education.

Question 84

Not answered

Marked out of 1.00

Question ID #13816: Learning a sequence of operant responses that each act as a secondary reinforcer and that eventually end in a primary reinforcer is known as:

Select one:

- ☐ A. shaping
- ☐ B. chaining
- ☐ C. differential reinforcement
- ☐ D. classical conditioning

The correct answer is B.

Chaining is believed to account for the acquisition of complex behaviors. It involves the association of responses such that each response acts as a secondary reinforcer and as a discriminative stimulus for the following response. The final reinforcer (the reinforcer that is delivered at the end of the "chain") is a primary reinforcer.

Answer A: Shaping involves successive approximations to the desired behavior.

Answer C: Differential reinforcement occurs when the target behavior is decreased by reinforcing behaviors other than the target behavior.

Answer D: Classical conditioning occurs when a neutral stimulus is repeatedly paired with an unconditioned stimulus so that the neutral (conditioned) stimulus eventually elicits a response similar to the one elicited by the unconditioned stimulus. Chaining is a intervention based on operant conditioning.

Question 85

Not answered

Marked out of 1.00

Question ID #11747: Which of the following is not one of the insecure attachment categories on the Adult Attachment Interview?

Select one:

- ☐ A. Dismissing
- ☐ B. Autonomous
- ☐ C. Preoccupied
- ☐ D. Unresolved/disorganized

The correct answer is B.

This is the only attachment style listed that is not an insecure attachment. Adults are classified as autonomous on the AAI when they give coherent descriptions of their childhood relationships with their parents. These adults tend to have children who exhibit a secure attachment in the strange situation.

Answer A: Adults are classified as dismissing on the AAI when they provide a positive description of their childhood relations with their parents, but the descriptions are either not supported or are contradicted by specific memories. Children of these adults often exhibit an avoidant attachment pattern.

Answer C: Adults are categorized as preoccupied on the AAI when they become very angry or confused when describing their childhood relationships with parents or seem passively preoccupied with a parent. Their children most often exhibit a resistant/ambivalent attachment pattern.

Answer D: Individuals with an unresolved/disorganized attachment exhibit trauma resulting from unresolved loss or abuse.

Question 86

Question ID #13726: Which specifier is used when a clinician believes that the full criteria for a diagnosis will eventually be met?

Select one:

- ☐ A. Unspecified
- ☐ B. Other specified
- ☐ C. Differential
- ☐ D. Provisional

The correct answer is D.

The provisional specifier is used when the clinician does not currently have sufficient information for a firm diagnosis but believes the full criteria for the diagnosis will eventually be met.

Answer A: This is a term used in diagnostic codes.

Answer B: This is also a term used in diagnostic codes.

Answer C: This is not a specifier.

Question 87

Not answered

Marked out of 1.00

Question ID #12924: The relationship between Type-I errors and Type-II errors can be depicted as_____.

Select one:

- ☐ A. a direct, positive correlation where the probability of making a Type-I error increases, the probability of making a Type-II error also increases
- ☐ B. sharing some commonalities but largely independent. Although both are related to significance and power, the probability of making a Type-I error is independent of making Type-II errors
- ☐ C. an inverse relationship
- ☐ D. unrelated. The probability of making a Type-I error has no impact on the probability of making a Type-II error

The correct answer is C.

The relationship between Type I and Type II errors is inverse, so as the probability of making a Type-I error increases, the probability of making a Type-II errors decreases, and vice versa. If you think of a Type I error as a false positive, and a Type II error as a false negative, in its most basic form, then the relationship is clearer.

Answer A: The relationship is an inverse relationship, not a positive correlation.

Answer B: While they are related to significance level and power, they are also inversely related rather than independent from one another.

Answer D: They have an inverse relationship rather than no relationship. As the chances of making a Type I error increases, the chances of making a Type II error decreases and vice versa.

Question 88

Not answered

Marked out of 1.00

Question ID #13916: Sperling (1960) had research participants stare at a blank screen onto which he flashed a display of letters for a fraction of a second and then asked them to recall as many of the letters as they could. Sperling was studying which of the following?

Select one:

- ☐ A. Flashbulb memory
- ☐ B. Semantic memory
- ☐ C. Iconic memory
- ☐ D. Echoic memory

The correct answer is C.

Iconic memory is an aspect of sensory memory that stores visual stimuli. Sperling was studying iconic memory.

Answer A: A flashbulb memory is a vivid and detailed image of what a person was doing at the time a dramatic event occurred, and it is a specific type of episodic memory.

Answer B: Semantic memory is the aspect of long-term memory that includes general knowledge.

Answer D: Echoic memory is the aspect of sensory memory that stores auditory stimuli.

Question 89

Question ID #13740: Fathers who have a child who has received a diagnosis of ADHD:

Select one:

- ☐ A. tend to rate the child's behaviors as less problematic than mothers do
- ☐ B. tend to rate the behaviors of their son (but not daughter) with ADHD as less problematic than mothers do
- ☐ C. tend to rate the behaviors of their daughter (but not son) with ADHD as less problematic than mothers do
- ☐ D. tend to rate the child's behaviors as more problematic than mothers do

The correct answer is A.

This is a difficult question because very few of the existing studies consider the reactions of fathers of children with ADHD. The limited research on this issue suggests that fathers of children with ADHD rate the behaviors of their children as less problematic. For example, E. J. Mash and C. Johnston found that fathers tend to rate the behaviors of children with ADHD as less troublesome than mothers (Parental perceptions of child behavior problems, parenting self-esteem, and mothers' reported stress in younger and older hyperactive and normal children, *Journal of Consulting and Clinical Psychology*, 51, 86-99, 1983). And, more recently, Singh interviewed 39 mothers and 22 fathers of boys who had received the diagnosis of ADHD and found that only four of the fathers felt their sons' behaviors required medical attention [Boys will be boys: Fathers' perspectives on ADHD symptoms, diagnosis, and drug treatment, *Harvard Review of Psychiatry*, 11(6), 308-316, 2003].

Answer B: The answer, "tend to rate the behaviors of their son (but not daughter) with ADHD as less problematic than mothers do", is incorrect. See explanation for response D.

Answer C: The answer, "tend to rate the behaviors of their daughter (but not son) with ADHD as less problematic than mothers do", is incorrect. See explanation for response D.

Answer D: The answer, "tend to rate the child's behaviors as more problematic than mothers do", is incorrect. See explanation for response D.

Question ID #12849: Which reasoning assessment does not require verbal responses or fine motor skills?

Select one:

- ☐ A. The Haptic Intelligence Scale for the Adult Blind
- ☐ B. The Peabody Picture Vocabulary Test-Fourth Edition
- ☐ C. The Cognitive Abilities Test
- ☐ D. The Columbia Mental Maturity Scale-Third Edition

The correct answer is D.

The Columbia Mental Maturity Scale-Third Edition (CMMS) is a test of general reasoning ability for children ages 3:6 through 9:11. A unique feature of the CMMS is that it does not require verbal responses or fine motor skills. The test consists of 92 cards that contain 3, 4, or 5 drawings; and, for each card, the examinee is required to indicate the drawing that does not belong with the others.

Answer A: The Haptic Intelligence Scale is for individuals who are blind or partially sighted. It makes use of tactile stimuli and includes six subtests: Digit Symbol, Object Assembly, Block Design, Object Completion, Pattern Board, and Bead Arithmetic. As the test requires fine motor skills, this response is incorrect.

Answer B: The Peabody Picture Vocabulary Test-Fourth Edition (PPVT-4) measures receptive vocabulary. Thus, this response is incorrect.

Answer C: The Cognitive Abilities Test (CogAT) measures an examinee's reasoning abilities in three areas that are linked to academic success - verbal, quantitative and nonverbal. As this reasoning assessment includes assessment of verbal ability, this response is incorrect.

Question 91

Question ID #11972: Josh hasn't started exploring what he wants to do, in fact, he has very little interest in choosing a career path. According to Marcia, which identity status is Josh most likely adopting?

Select one:

- ☐ A. Identity moratorium
- ☐ B. Identity diffusion
- ☐ C. Identity foreclosure
- ☐ D. Identity achievement

The correct answer is B.

Adolescents exhibiting diffusion have not yet experienced an identity crisis or explored alternatives and are not committed to an identity. This is reflected in Josh's lack of interest in pursuing career options.

Answer A: Identity moratorium occurs when an adolescent experiences an identity crisis and actively explores alternative identities.

Answer C: Adolescents are in the state of foreclosure when they haven't experienced a crisis but have adopted an identity (occupation, ideology, etc.) that has been imposed by the same-sex parent or other person.

Answer D: Adolescents who have resolved the identity crisis by evaluating alternatives and committing to an identity are "identity achieved."

Question ID #13941: A group therapy member is typically providing advice when other members of the group speak up. Which stage of the group process is this member MOST likely in?

Select one:

- ☐ A. third stage
- ☐ B. first stage
- ☐ C. second stage
- ☐ D. there are no stages to the group process

The correct answer is B.

According to Yalom, the first stage of group therapy is characterized by attempts to determine the group's structure and meaning; a stereotyped, restricted, and rational communication style; a search for similarities among group members; and advice seeking and giving.

Answer A: During the third stage, group cohesiveness develops. As a result, unity, intimacy, and closeness become the chief concerns; trust and self-disclosure increase; attendance improves, and members show concern whenever a member is absent.

Answer C: In the second stage, "each member attempts to establish his or her preferred amount of initiative and power; and gradually a control hierarchy, a social pecking order, emerges" (p. 304). Advice giving is replaced by criticism, judgmental statements, and other negative comments.

Answer D: In his book, *The Theory and Practice of Group Psychotherapy*, Irvin Yalom (1985) describes the first few months of group therapy as involving three formative stages.

Question 93

Marked out of 1.00

Question ID #11804: Christy is a 16 year old who has a secure attachment to her parents. According to Joseph Allen and his colleagues, Christy should have ____.

Select one:

- ☐ A. a high capacity for intimacy
- ☐ B. a slightly higher risk for experimenting with alcohol than peers with different attachment styles
- ☐ C. fewer friends than her peers, because she spends more time with her parents
- ☐ D. high grades in school

The correct answer is A.

Healthy attachments are the basis for healthy relationships in adulthood. Individuals with a secure attachment are most likely to have successful interpersonal relationships than individuals with insecure attachment styles.

Answer B: A secure attachment is more likely to be a protective factor than a risk factor for alcohol and other substance use.

Answer C: Transitioning from a family focus to a peer focus is typical in adolescent development and a secure attachment style is not going to make an adolescent more likely to spend time with their parents. Because Christy has a secure attachment, she is better situated to successfully explore peer relationships and development positive interpersonal relationships.

Answer D: High grades are a result of a secure attachment. There are many factors that may impact someone's grades.

Question ID #13583: Which of the following requires the presence of symptoms that involve disturbances in voluntary motor or sensory functioning?

Select one:

- ☐ A. Somatic Symptom Disorder
- ☐ B. Illness Anxiety Disorder
- ☐ C. Conversion Disorder
- ☐ D. Factitious Disorder

The correct answer is C.

Conversion Disorder (Functional Neurological Symptom Disorder) requires the presence of symptoms that involve disturbances in voluntary motor or sensory functioning and suggest a serious neurological or other medical condition, with evidence of an incompatibility between the symptom and recognized medical conditions.

Answer A: Somatic Symptom Disorder involves the presence of one or more somatic symptoms that cause distress.

Answer B: Illness Anxiety Disorder is characterized by a preoccupation with having a serious illness and an absence of somatic symptoms or the presence of mild somatic symptoms.

Answer D: Individuals diagnosed with Factitious Disorder Imposed on Self falsify physical or psychological symptoms that are associated with their deception. They engage in deceptive behavior even in the absence of an external reward.

Marked out of 1.00

Question ID #12356: The criminal justice system provides intervention at what level of prevention?

Select one:

- ☐ A. Primary
- ☐ B. Secondary
- ☐ C. Tertiary
- ☐ D. Quaternary

The correct answer is C.

Methods of prevention are classified based on the level of intervention. Primary prevention focuses on all members of an identified group. Secondary prevention targets specific individuals who are at high risk. Tertiary prevention intervenes after the incidence of the behavior. The criminal justice system intervenes after an individual engages in a criminal act.

Answer A: The criminal justice system provides intervention at the tertiary, not the primary, level of prevention. See explanation for answer C.

Answer B: The criminal justice system provides intervention at the tertiary, not the secondary, level of prevention. See explanation for answer C.

Answer D: The criminal justice system provides intervention at the tertiary, not the quaternary level of prevention. See explanation for answer C.

Question 96

Not answered

Marked out of 1.00

Question ID #12552: The view that depression is the result of exposure to an aversive event coupled with the tendency to attribute negative events to personal, global, and stable factors is consistent with:

Select one:

- ☐ A. the reformulated learned helplessness model
- ☐ B. the fundamental attribution bias
- ☐ C. the original aversive events model
- ☐ D. Rehm's self-control model

The correct answer is A.

In the late 1970s, the learned helplessness model was expanded to include the role of attributions in the development of depression. (Note that, as described in the Abnormal Psychology chapter of the written study materials, the most recent version of the model places less emphasis on attributions and, instead, focuses on the role of hopelessness.)

Answer B: The fundamental attribution bias refers to the tendency to attribute the behavior of others to dispositional factors.

Answer C: The "original aversive events model" is a "made-up" term.

Answer D: Rehm's self-control model views depression as being the result of problems related to self-monitoring, self-evaluation, and self-reinforcement.

Question 97

Question ID #11955: Which of the following statements about processing speed is not true?

Select one:

- ☐ A. Processing speed decreases with age.
- ☐ B. Processing speed has been linked with good performance on cognitive tasks.
- ☐ C. Strategies exist for compensating for slower processing speed.
- ☐ D. Processing speed increases with age.

The correct answer is D.

A hallmark of cognitive aging is slowed processing speed, or a decrease in the rate at which people perform perceptual, motor, and decision making tasks.

Answer A: This is true. As individuals age, their processing speed slows.

Answer B: Processing speed has been linked to good performance on cognitive tasks so much so, that it is a factor in determining cognitive functioning or intelligence.

Answer C: This is true. There are modifications and strategies that individuals can use to compensate for slower processing speed.

Marked out of 1.00

Question ID #13382: The symptoms of Major Depressive Disorder vary somewhat with age. Somatic complaints, irritability, and social withdrawal:

Select one:

- ☐ A. are common in children
- ☐ B. are common in preadolescents
- ☐ C. are common in older adults
- ☐ D. are common in preadolescent males

The correct answer is A.

The symptoms of Major Depressive Disorder vary somewhat with age. Somatic complaints, irritability, and social withdrawal are common in children.

Answer B: Aggressiveness and destructiveness may occur in preadolescents.

Answer C: In older adults, memory loss, distractibility, disorientation, and other cognitive symptoms may be present.

Answer D: Preadolescent males more commonly demonstrate aggressiveness and destructiveness.

Question 99

Not answered

Marked out of 1.00

Question ID #10606: Broadbent (1958) used the dichotic listening task to investigate the predictions of his filter theory of attention. This task involved having the listener hear different messages presented simultaneously to each ear and then verbally report what he/she had heard. For example, in a typical study, three digits (e.g., 5, 2, 7) were presented to one ear, while three other digits (e.g., 4, 9, 8) were simultaneously presented to the other ear. The results of these studies confirmed Broadbent's theory because, in most cases, listeners reported that they had heard which of the following?

Select one:

- ☐ A. 5-4-2-9-7-8
- ☐ B. 5-2-7-4-9-8
- ☐ C. 5-2-7 only OR 4-9-8 only
- ☐ D. 7-8 only

The correct answer is B.

Broadbent's (1958) filter theory of attention was the first comprehensive theory of attention and the first of the "bottleneck" theories. It proposes that a filter (i.e., sensory buffer) selects which incoming message will be further processed or attended to on the basis of the physical properties of the message. Most participants in Broadbent's studies reported the information by one ear then the other ear rather than by the chronological order in which they heard the digits. Broadbent concluded that this proved that the physical properties of the message determined if it was attended to or ignored. In other words, in the dichotic listening task studies, the filter allowed the message from one ear to "pass through" before it allowed the message from the other ear to do so, which explained why participants would report the digits heard in one ear first, followed by the digits heard in the other ear.

Answer A: Listeners most often reported the information presented in one ear followed by the information presented in the other ear.

Answer C: Listeners were able to report information presented to both ears.

Answer D: Listeners were most often able to report all digits presented to them.

Question 100

Not answered

Marked out of 1.00

Question ID #14420: The general adaptation syndrome (GAS), named by Selye (1956), is mediated primarily by the adrenal and pituitary glands and involves three stages. Which of the following stages causes the hypothalamus to activate the adrenal medulla to increase its release of epinephrine (adrenaline)?

Select one:

- ☐ A. resistance
- ☐ B. alarm reaction
- ☐ C. exhaustion
- ☐ D. extinction

The correct answer is B.

Alarm reaction occurs in response to stress. As a result of epinephrine being released, the body's glucose level rises, and heart and respiration rates accelerate, thereby increasing the body's energy level.

Answer A: The resistance stage occurs if the stress persists. In this stage, breathing and heart rates return to normal levels, but the hypothalamus signals the pituitary gland to release adrenocorticotrophic hormone (ACTH).

Answer C: With prolonged stress, the exhaustion stage begins. The pituitary gland and the adrenal cortex lose their ability to maintain elevated hormone levels, and physiological processes start to break down. Fatigue, depression, and illness (e.g., ulcers, essential hypertension) or, in extreme cases, death, may occur.

Answer D: Extinction is a behavioral term that refers to the eventual elimination of undesirable behaviors.

Question 101

Marked out of 1.00

Question ID #13350: In a multitrait-multimethod matrix, the _____ coefficients are correlation coefficients that provide information about a test's convergent validity.

Select one:

- ☐ A. heterotrait-heteromethod
- ☐ B. heterotrait-monomethod
- ☐ C. monotrait-heteromethod
- ☐ D. monotrait-monomethod

The correct answer is C.

A monotrait-heteromethod coefficient indicates the correlation between the same trait being measured with different methods. It provides information about a test's convergent validity.

Answer A: A heterotrait-heteromethod coefficient provides information about a test's divergent validity.

Answer B: A heterotrait-monomethod coefficient also provides information about a test's divergent validity.

Answer D: The monotrait-monomethod coefficient provides information about a test's reliability.

Question 102

Marked out of 1.00

Question ID #13874: A person with associative visual agnosia:

Select one:

- ☐ A. can name a familiar object she sees but does not know how to use it
- ☐ B. can name a familiar object spontaneously but not when she is asked to do so
- ☐ C. cannot name a familiar object she sees but may recognize it when it is placed in her hand and cannot copy or match a drawing of the object
- ☐ D. cannot name a familiar object she sees but may know what it is used for and can copy or match a drawing of the object

The correct answer is D.

The term visual agnosia refers to the inability to recognize familiar objects by sight. Associative and apperceptive visual agnosia are two types of visual agnosia that you want to be familiar with for the EPPP. This response describes associative visual agnosia, which occurs when visual and language areas become disconnected.

Answer A: This is not characteristic of visual agnosia.

Answer B: This does not describe associative visual agnosia.

Answer C: This response describes the condition known as apperceptive visual agnosia.

Question 103

Not answered

Marked out of 1.00

Question ID #13357: A psychologist develops a test that purports to measure confidence. What information indicates how close an obtained score is to a true score?

Select one:

- ☐ A. Reliability coefficient
- ☐ B. Validity coefficient
- ☐ C. Standard error of measurement
- ☐ D. Standard error of estimate

The correct answer is C.

Since no test is completely reliable, any test score may be in error (i.e., may not reflect the examinee's "true" test score). Consequently, the best strategy is to interpret the examinee's score in terms of a confidence interval. The standard error of measurement is an index of error and is used to construct an interval in which an examinee's true test score is likely to fall given his or her obtained test score.

Answer A: Reliability is a measure of the extent to which a test consistently measures the attribute assessed by the test. A reliability coefficient is interpreted directly as the proportion of variability in obtained test scores that reflects true score variability.

Answer B: Validity refers to a test's accuracy. The validity coefficient indicates the extent to which a test measures what is designed to measure.

Answer D: The standard error of estimate is used to construct a confidence interval around an estimated (predicted) score.

Question 104

Not answered

Marked out of 1.00

Question ID #12874: The idea that people prefer to receive information about themselves which is consistent with their own evaluations is the essence of the following theory:

Select one:

- ☐ A. social exchange theory
- ☐ B. equity theory
- ☐ C. self-verification theory
- ☐ D. balance theory

The correct answer is C.

Self-verification theory sounds like what it is—we tend to prefer receiving feedback from others that verifies our own self-evaluations.

Answers A, B, and D: These answers do not describe self-verification theory.

Question 105

Not answered

Marked out of 1.00

Question ID #11713: Procedural memory is to declarative memory as:

Select one:

- ☐ A. echoic is to iconic
- ☐ B. fact is to experience
- ☐ C. explicit is to implicit
- ☐ D. skill is to fact

The correct answer is D.

Long-term memory can be conceptualized in terms of two basic types or categories - procedural and declarative. As its name implies, procedural memory contains memories for procedures - that is, perceptual, cognitive, and motor skills. Declarative memory (which is subdivided into semantic and episodic memory) contains memories for facts and events.

Answer A: The terms echoic and iconic are used to describe sensory memories and refer, respectively, to memory for auditory stimuli and memory for visual stimuli. The terms echoic and iconic provide cues as to what they refer—i.e., "echo" suggests sound, while "icon" suggests an image.

Answer B: Declarative memory contains facts, and episodic memory contains events that have been personally experienced.

Answer C: Procedural memory is typically implicit, meaning that it does not take conscious effort to recall how to do something. Declarative memory is more often explicit, meaning that it may take conscious effort to retrieve a memory.

Question 106

Not answered

Marked out of 1.00

Question ID #13866: Adequate "floor" is especially important when a test will be used to:

Select one:

- ☐ A. make intra-individual comparisons
- ☐ B. confirm a diagnosis of Intellectual Disability
- ☐ C. assign students to advanced placement classes
- ☐ D. evaluate the readiness of employees for promotion

The correct answer is B.

In the context of testing, "floor" refers to the test's ability to discriminate among examinees at the low end of the score range. To make a diagnosis of Intellectual Disability and distinguish between different levels of severity, you have to be able to discriminate among individuals with low intelligence. This requires adequate "floor" - i.e., the test has to have enough easy items to distinguish between people with different levels of low intelligence.

Answer A: Adequate floor has no relevance for intra-individual assessment.

Answer C: Adequate floor is not essential when performing advanced placement testing.

Answer D: Adequate floor has little relevance for employee readiness assessment.

Question 107

Not answered

Marked out of 1.00

Question ID #13359: Assuming a normal distribution, which of the following norm-referenced scores is the highest?

Select one:

- ☐ A. 95th percentile
- ☐ B. Stanine score of 7
- ☐ C. z-score of 2.0
- ☐ D. T-score of 40

The correct answer is C.

For the exam, you want to be familiar with the relationship of z-scores, T-scores, WAIS-IV IQ scores, and Standard Nines (stanines) in a normal distribution so that you can answer questions like this one. A z-score is two standard deviations above the mean and represents the highest norm-referenced score from the answer choices provided.

Answer A: A percentile rank of 95 is approximately one and one-half standard deviations above the mean.

Answer B: A Stanine score of 7 is approximately one standard deviation above the mean.

Answer D: A T-score of 40 is one standard deviation below the mean.

Question 108

Not answered

Marked out of 1.00

Question ID #13747: Kopta and his colleagues (1994) reviewed the recovery rates for 854 psychotherapy clients and found that, for acute symptoms, nearly 75% of the patients showed an alleviation of symptoms ("recovery") after the 28th therapy session. Their findings are:

Select one:

- ☐ A. inconsistent with earlier research by Howard et al. (1986) which found that only 15% of therapy clients showed substantial improvement after the 26th session
- ☐ B. inconsistent with earlier research by Howard et al. (1986) which found that only 48% of therapy clients showed substantial improvement in symptoms after the 26th session
- ☐ C. inconsistent with earlier research by Howard et al. (1986) which found that nearly 96% of therapy clients showed substantial improvement in symptoms after the 26th session
- ☐ D. consistent with earlier research by Howard et al. (1986) which found that 75% of therapy clients showed substantial improvement in symptoms after the 26th session

The correct answer is D.

This question requires you to be familiar with Howard et al.'s research on the "dose-dependent effect" of psychotherapy, which is summarized in the Clinical Psychology chapter of the written study materials. K. I. Howard, S. M. Kopta, M. S. Krause, and D. E. Orlinsky found that after the 26th therapy session, 75% of therapy clients included in their study showed a marked improvement in symptoms (The dose-effect relationship in psychotherapy, *American Psychologist*, 41 159-164, 1986).

Answer A: The answer, "inconsistent with earlier research by Howard et al. (1986) which found that only 15% of therapy clients showed substantial improvement after the 26th session.", is incorrect. See explanation for response D.

Answer B: The answer, "inconsistent with earlier research by Howard et al. (1986) which found that only 48% of therapy clients showed substantial improvement in symptoms after the 26th session.", is incorrect. See explanation for response D.

Answer C: The answer, "inconsistent with earlier research by Howard et al. (1986) which found that nearly 96% of therapy clients showed substantial improvement in symptoms after the 26th session.", is incorrect. See explanation for response D.

Question 109

Not answered

Marked out of 1.00

Question ID #11734: What is the main difference between Kohlberg's and Gilligan's theories of moral development?

Select one:

- ☐ A. Gilligan postulated an ethic of equity; Kohlberg postulated an ethic of care.
- ☐ B. Kohlberg postulated an ethic of justice; Gilligan postulated an ethic of care.
- ☐ C. Gilligan postulated an ethic of justice; Kohlberg postulated an ethic of care.
- ☐ D. Gilligan postulated an ethic of individualism; Kohlberg postulated an ethic of collectivism.

The correct answer is B.

Gilligan (1982) noted that Kohlberg's original research participants were males and as a result, his theory is not as applicable to females whose moral judgments are influenced less by concerns about justice and individual rights and more by concerns related to caring, compassion, and responsibility to others.

Answer A: Gilligan postulated an ethic of care, not Kohlberg.

Answer C: This is the opposite of their theories. Kohlberg focused on justice, whereas Gilligan focused on care.

Answer D: This is the opposite of their theories. Gilligan focused more on the concept of caring and responsibility to others, whereas Kohlberg focused on justice and the individual.

Question 110

Not answered

Marked out of 1.00

Question ID #14406: Which of the following is a symptom that reflects insufficient functioning with examples including social withdrawal, blunted affect, and impoverishment of thought and speech?

Select one:

- ☐ A. negative symptom
- ☐ B. hallucination
- ☐ C. positive symptom
- ☐ D. delusion

The correct answer is A.

Negative symptoms refer to an abnormality that results from normal functions that have been lost, for example, slow and impoverished thought and speech, emotional and social withdrawal, or blunted affect.

Answer B: Hallucinations are perception-like experiences that occur without the presence of external stimuli.

Answer C: Positive symptoms refer to abnormal behavioral states that have been gained; examples include hallucinations, delusions, and excited motor behaviors.

Answer D: A delusion is a false belief that is strongly held in spite of contrary evidence.

Question 111

Not answered

Marked out of 1.00

Question ID #13772: Which of the following best describes research findings on the impact of serotonin levels on the eating behaviors of individuals with an Eating Disorder?

Select one:

- ☐ A. Low levels of serotonin are believed to precipitate binge eating in Bulimia and starvation in Anorexia.
- ☐ B. High levels of serotonin are believed to precipitate binge eating in Bulimia and starvation in Anorexia.
- ☐ C. High levels of serotonin are believed to precipitate starvation in Anorexia while low levels are believed to precipitate binge eating in Bulimia.
- ☐ D. Low levels of serotonin are believed to precipitate starvation in Anorexia while high levels are believed to precipitate binge eating in Bulimia.

The correct answer is C.

High levels of serotonin have been linked to both appetite suppression and anxiety. Reduced caloric intake by those with Anorexia apparently fosters a sense of calm and personal control by lowering serotonin levels. Low levels of serotonin have been linked to depression and apparently contribute to binge eating in Bulimia - i.e., bingeing on sweets and carbohydrates increases serotonin levels and thereby elevates mood.

Answer A: The answer, "Low levels of serotonin are believed to precipitate binge eating in Bulimia and starvation in Anorexia.", is incorrect. See explanation for response C.

Answer B: The answer, "High levels of serotonin are believed to precipitate binge eating in Bulimia and starvation in Anorexia.", is incorrect. See explanation for response C.

Answer D: The answer, "Low levels of serotonin are believed to precipitate starvation in Anorexia while high levels are believed to precipitate binge eating in Bulimia.", is incorrect. See explanation for response C.

Question 112

Marked out of 1.00

Question ID #10904: Which type of conditioning takes place when the unconditioned stimulus occurs first, followed by the presentation of the conditioned stimulus?

Select one:

- ☐ A. Backward conditioning
- ☐ B. Forward conditioning
- ☐ C. Trace conditioning
- ☐ D. Delay conditioning

The correct answer is A.

Backward conditioning involves presenting the unconditioned stimulus (US) before the conditioned stimulus (CS) and is rarely effective, especially in non-human animals.

Answer B: The success of classical conditioning is affected by several factors, including the temporal relationship between presentation of the US and the CS. Forward conditioning refers to conditioning that occurs when the CS is presented before the US.

Answer C: Trace conditioning is a type of forward conditioning in which the CS is presented and terminated before presenting the US. It is not as effective as delay conditioning.

Answer D: Delay conditioning is a type of forward conditioning that involves presenting the CS so that it precedes and overlaps presentation of the US. It is the most effective method for establishing a conditioned response.

Question 113

Not answered

Marked out of 1.00

Question ID #13776: As defined by Piaget, egocentrism during the preoperational stage of cognitive development is a manifestation of:

Select one:

- ☐ A. primary circular reactions
- ☐ B. transduction
- ☐ C. horizontal decalage
- ☐ D. centration

The correct answer is D.

Piaget distinguished between four stages of cognitive development. The preoperational stage extends from ages 3 to 6 years. Knowing that Piaget described centration as a primary limitation of the preoperational stage would have helped you identify this as the correct answer. Piaget believed that egocentrism is a form of centration - i.e., young children cannot take into account their own point of view and the point of view of another person at the same time.

Answer A: Primary circular reactions are characteristic of babies between the ages of 1 and 4 months and involve the repetition of pleasurable actions.

Answer B: Transductive thinking is characteristic of the preoperational stage. However, as defined by Piaget, it refers to reasoning characterized by a tendency to move from one particular case to another particular case without taking the general into account (e.g., I had bad thoughts about my mom; she got sick; therefore, my thoughts made her sick).

Answer C: Horizontal decalage refers to the inability to transfer one type of conservation to another (e.g., the conservation of substance to weight or volume).

Question 114

Not answered

Marked out of 1.00

Question ID #14408: Lithium is most effective for:

Select one:

- ☐ A. Bipolar Disorder with rapid cycling.
- ☐ B. Bipolar Disorder with anxious distress.
- ☐ C. classic Bipolar Disorder.
- ☐ D. Bipolar Disorder with melancholic features.

The correct answer is C.

Lithium has traditionally been the treatment-of-choice for Bipolar Disorder. Recent studies suggest, however, that carbamazepine and other anticonvulsant drugs are more effective for certain types of Bipolar Disorder. Lithium is still considered the best choice for classic Bipolar Disorder.

Answer A: Carbamazepine may be more effective for Bipolar Disorder with rapid cycling.

Answer B: Anticonvulsant medications such as valproate and lamotrigine have been found effective for the treatment of Bipolar Disorder with anxious distress.

Answer D: Recent studies suggest that the anticonvulsants drugs carbamazepine or lamotrigine may be effective for the treatment of Bipolar Disorder with melancholic features.

Question 115

Marked out of 1.00

Question ID #10793: Dr. Peterson believes students should participate in research studies as participants, because she views that experience as central to their experience as psychology majors. Dr. Peterson decides to require her students to sign up to participate in the psychology department subject pool. Dr. Peterson is behaving _____.

Select one:

- ☐ A. ethically, because participation is part of students' educational experience
- ☐ B. ethically, only if the experiments do not cause harm or distress
- ☐ C. unethically unless she offers them extra credit for their time
- ☐ D. unethically unless she provides a comparable alternative option

The correct answer is D.

Standard 8.04 states that when participation in research is required for a course (whether part of a grade or for extra credit), students must be offered alternative activities.

Answer A: Instructors must provide students with an alternative and comparable means by which to obtain credit.

Answer B: This answer fails to account for the central concern of this question, which is that instructors provide an alternative means of obtaining credit.

Answer C: This answer is incorrect. Extra credit is permissible, provided students have an alternative way to earn it besides through participating in research.

Question ID #11869: Which of the following situations best exemplifies Kohlberg's preconventional stage?

Select one:

- ☐ A. Sarah, a law enforcement officer, refused to enforce laws that are unjust or unfair to people of color.
- ☐ B. Zach doesn't agree with how the Latinx students at his school are being treated unfairly, but he doesn't join the protest because he doesn't have his parents' permission.
- ☐ C. Mikey doesn't want to steal the soda because he will get in trouble.
- ☐ D. Bella doesn't skip school because she is worried about what her friends will say.

The correct answer is C.

This type of thinking is reflective of the most basic form of moral reasoning, according to Kohlberg. Individuals in the preconventional stage have a Punishment and Obedience Orientation where the goodness or badness of an act depends on its consequences. For individuals at this stage, the right course of action is the one that allows them to avoid punishment.

Answer A: This represents moral reasoning in the postconventional stage where moral reasoning is based on individual rights and justice.

Answer B: This represents thinking in the conventional stage.

Answer D: This represents thinking in the conventional stage. Specifically, the "Good Boy/Good Girl" Orientation posits that the right action is the one that is liked or approved of by others.

Question 117

Marked out of 1.00

Question ID #12130: Which of the following best describes ethical requirements regarding sexual intimacies with supervisees?

Select one:

- ☐ A. Ethical guidelines do not prohibit sexual relationships with supervisees.
- ☐ B. Ethical guidelines prohibit sexual relationships with supervisees under any circumstances.
- ☐ C. Ethical guidelines prohibit sexual relationships with current supervisees only when the relationship will impair the psychologist's objectivity and effectiveness as a supervisor.
- ☐ D. Ethical guidelines prohibit sexual relationships with supervisees over whom the psychologist has evaluative authority.

The correct answer is D.

Being familiar with the exact language of the ethical guidelines would have allowed you to identify the correct response to this question. Standard 7.07 of the APA's Ethics Code and Principle II.28 of the Canadian Code of Ethics prohibit psychologists from becoming involved in sexual relationships with students and supervisees over whom they have evaluative authority.

Answer A: Is incorrect, because ethics codes prohibit sexual intimacies with supervisees when there is an evaluative relationship.

Answer B: This answer is incorrect as the language specifies that supervisors who have an evaluative role with supervisees should not engage in sexual intimacies.

Answer C: This answer is incorrect. Supervisors are prohibited from having sexual intimacies with their supervisees when they are in an evaluative role.

Question 118

Not answered

Marked out of 1.00

Question ID #10913: Which of the following occurs when newly learned information interferes with the recall of previously learned information?

Select one:

- ☐ A. Retrieval failure
- ☐ B. Trace decay theory
- ☐ C. Proactive interference
- ☐ D. Retroactive interference

The correct answer is D.

Retroactive interference refers to conditions in which newly learned information interferes with the recall of previously learned (old) information.

Answer A: Retrieval failure is the failure to recall information in the absence of memory cues.

Answer B: Trace decay theory states that if memories are not recalled consistently, they will begin to decay and will ultimately be forgotten.

Answer C: Proactive interference occurs when previously learned information interferes with the recall of newly learned information.

Question 119

Marked out of 1.00

Question ID #13354: For a test with a mean of 100 and standard deviation of 15, the upper and lower limits of the standard error of measurement are:

Select one:

- ☐ A. 0 to +1.0
- ☐ B. -1.0 to +1.0
- ☐ C. 0 to 100
- ☐ D. 0 to 15

The correct answer is D.

Knowing the formula for the standard error of measurement would have helped you identify the correct answer to this question. The standard error of measurement equals the standard deviation times the square root of one minus the reliability coefficient. When a test's reliability coefficient is equal to +1.0 (the highest reliability coefficient possible), there is no error in measurement and the standard error of measurement equals zero. At the other extreme, when the test's reliability coefficient is equal to 0, the standard error of measurement equals the standard deviation of the test scores.

Answers A, B, & C are incorrect.

Question 120

Marked out of 1.00

Question ID #13746: Which of the following accurately describes the utilization rates for mental health services among Whites and African Americans?

Select one:

- ☐ A. Compared to Whites, African Americans have higher utilization rates for both inpatient and outpatient mental health services.
- ☐ B. Compared to Whites, African Americans have lower utilization rates for both inpatient and outpatient mental health services.
- ☐ C. Compared to Whites, African Americans have lower rates for outpatient mental health services but higher rates for public inpatient mental health services.
- ☐ D. Compared to Whites, African Americans have higher rates for outpatient mental health services but lower rates for public inpatient mental health services.

The correct answer is C.

As noted in the Clinical Psychology chapter of the written study materials, research by Snowden et al. and others has consistently identified disparities in the utilization rates for some ethnic minority groups when compared to the rates for Whites. Snowden et al.'s data indicate that, in comparison to Whites, African Americans are overrepresented in public inpatient mental health services but are underrepresented in outpatient mental health services. See, e.g., L. R. Snowden, African American service use for mental health problems, *Journal of Community Psychology*, 27(3), 303-313, 1999.

Answer A: The answer, "Compared to Whites, African Americans have higher utilization rates for both inpatient and outpatient mental health services.", is incorrect. See explanation for response C.

Answer B: The answer, "Compared to Whites, African Americans have lower utilization rates for both inpatient and outpatient mental health services.", is incorrect. See explanation for response C.

Answer D: The answer, "Compared to Whites, African Americans have higher rates for outpatient mental health services but lower rates for public inpatient mental health services.", is incorrect. See explanation for response C.

Question 121

Question ID #14407: Tourette's Disorder, Autism Spectrum Disorder, and Obsessive-Compulsive Disorder have been most consistently linked to pathology in which areas of the brain?

Select one:

- ☐ A. amygdala and parietal lobes
- ☐ B. thalamus and parietal lobes
- ☐ C. thalamus and frontal lobes
- ☐ D. basal ganglia and frontal lobes

The correct answer is D.

Research using brain imaging techniques has consistently linked abnormalities in certain areas of the brain to Tourette's Disorder, Autism Spectrum Disorder, and Obsessive-Compulsive Disorder. Abnormalities in the basal ganglia and front lobes have been implicated in all three disorders.

Answers A, B, and C: Abnormalities in the basal ganglia and front lobes have been implicated in all three disorders.

Question 122

Marked out of 1.00

Question ID #10726: The EPPP is helpful as a measure of psychologists' _____.

Select one:

- ☐ A. competence
- ☐ B. knowledge
- ☐ C. training
- ☐ D. reasoning ability

The correct answer is B.

The EPPP is designed to assist boards "in their evaluation of the qualifications of applicants for licensure and certification" by assessing "the knowledge that the most recent practice analysis has determined as foundational to the competent practice of psychology" (ASPPB, 2010).

Answer A: The EPPP is an assessment of knowledge, and while knowledge is a component of competence, this answer is less accurate than the answer that states the test evaluates knowledge.

Answer C: The EPPP does not evaluate training.

Answer D: While reasoning is involved in responding to answers on the EPPP, the test is designed as an assessment of knowledge.

Question 123

Not answered

Marked out of 1.00

Question ID #13942: Research on "gendered environments" suggests that, in the classroom:

Select one:

- ☐ A. boys have more interactions with teachers and tend to receive more feedback and praise
- ☐ B. girls have more interactions with teachers and tend to receive more feedback and praise
- ☐ C. boys get more praise from teachers, while girls receive more criticism
- ☐ D. boys get more criticism from teachers, while girls receive more praise and assistance

The correct answer is A.

The research on teacher behaviors is inconsistent and difficult to summarize. However early studies as well as more recent ones do seem to suggest that teachers respond differently to male and female students. Of the responses given, this is the best summary of the research. Males receive more attention from teachers and that attention often fosters better academic achievement.

Answer B: The opposite is true.

Answers C & D: The general consensus of research has not substantiated these statements.

Question 124

Not answered

Marked out of 1.00

Question ID #12836: Which measure is a broad-band scale ADHD assessment?

Select one:

- ☐ A. The Child Behavior Checklist
- ☐ B. The Attention Deficit Disorders Evaluation Scales
- ☐ C. The Conners' Continuous Performance Test
- ☐ D. The ADHD Rating Scale IV

The correct answer is A.

The diagnosis of Attention-Deficit/Hyperactivity Disorder (ADHD) incorporates a number of techniques and informants. The assessment often begins with a broad-band scale that assesses general behavioral and psychological functioning and helps distinguish ADHD from other disorders. These include the Behavioral Assessment System for Children, Second Edition (BASC-2) and the Child Behavior Checklist (CBCL).

Answer B: The Attention Deficit Disorders Evaluation Scales, Third Edition (ADDES-III) includes a list of symptoms that parallel those presented in the DSM for ADHD. However, this measure falls into the category of narrow-band scales, which are used to obtain detailed information on the individual's symptoms to confirm the diagnosis and facilitate treatment planning and evaluation.

Answer C: The Conners' Continuous Performance Test (CPT) is a narrow-band scale used to obtain detailed information on the individual's symptoms to confirm the diagnosis and facilitate treatment planning and evaluation. The CPT-3 is used to evaluate changes in attention over time.

Answer D: The ADHD Rating Scale-IV is also a narrow-band scale, which includes a list of symptoms that parallel those presented in the DSM for this disorder.

Question 125

Marked out of 1.00

Question ID #13982: All of the following can be used to indicate diagnostic uncertainty except:

Select one:

- ☐ A. provisional (code)
- ☐ B. provisional (specifier)
- ☐ C. unspecified disorder
- ☐ D. other specified disorder

The correct answer is A.

The DSM-5 provides two codes and one specifier that can be used to indicate diagnostic uncertainty. The provisional label is used as a diagnostic specifier rather than a code.

Answer B: The provisional specifier may be used when the clinician does not currently have sufficient information for a firm diagnosis but believes the full criteria for the diagnosis will eventually be met.

Answer C: Unspecified disorder is coded when the clinician does not want to indicate the reason why the client's symptoms do not meet the criteria for a specific diagnosis.

Answer D: Other specified disorder is coded when the clinician wants to indicate the reason why the client's symptoms do not meet the criteria for a specific diagnosis.

Question 126

Not answered

Marked out of 1.00

Question ID #12904: What is the result when a multiple correlation coefficient and multiple regression equation are tried on another sample?

Select one:

- ☐ A. The size of the correlation coefficient tends to shrink and the predictive accuracy of the regression equation decreases.
- ☐ B. The size of the correlation coefficient tends to shrink and the predictive accuracy of the regression equation increases.
- ☐ C. The size of correlation coefficient tends to increase and the predictive accuracy of the regression equation decreases.
- ☐ D. The size of the correlation coefficient tends to increase and the predictive accuracy of the regression equation increases.

The correct answer is A.

When a multiple correlation coefficient and multiple regression equation are tried on another sample, the size of the correlation coefficient tends to shrink due to regression toward the mean of the original sample. When the correlation coefficient shrinks, the accuracy of the equation also declines.

Answer B: The predictive accuracy of the regression equation would decrease not increase.

Answer C: The size of the correlation coefficient would decrease due to regression toward the mean of the original sample.

Answer D: The size of the correlation coefficient would decrease due to regression toward the mean of the original sample and this would also result in a decrease in predictive accuracy.

Question 127

Not answered

Marked out of 1.00

Question ID #11876: Melanie, age 16, and Erin, age 26, are likely to differ in their cognitive abilities. Which of the following differences is most likely?

Select one:

- ☐ A. Erin will view the world more narrowly than Melanie.
- ☐ B. Melanie will be more realistic in her thinking than Erin.
- ☐ C. Melanie is more likely than Erin to view the world in absolute terms.
- ☐ D. Erin will be more idealistic in her thinking than Melanie.

The correct answer is C.

Although both Melanie and Erin will likely be in a formal operational stage of thought, meaning they will develop skills in thinking abstractly and hypothetical-deductive reasoning, Melanie is still an adolescent whereas Erin is in her mid-20s. The range of life experiences combined with cognitive and socio-emotional development will allow Erin to think more broadly, whereas Melanie's limited experiences, emerging formal operational skills, and egocentric focus (consistent with adolescence) will narrow her scope and result in more restricted views.

Answer A: Actually, the opposite is true. Melanie would be more likely to view the world in narrow terms because of her developmental level.

Answer B: Melanie will be less realistic in her thinking than Erin. Melanie is still developing formal operational skills and her egocentric focus at this stage of development (i.e., the personal fable & the imaginary audience) will be barrier to more realistic thinking.

Answer D: Erin will actually be more realistic, whereas Melanie would be more idealistic.

Question 128

Not answered

Marked out of 1.00

Question ID #13859: As defined by Salvador Minuchin, triangulation is:

Select one:

- ☐ A. a therapeutic technique that helps family members achieve insight
- ☐ B. a structural configuration that is desirable because it improves communication
- ☐ C. a chronic boundary problem that serves a conflict-diffusing function
- ☐ D. a chronic boundary disturbance involving "talking through" rather than "talking to"

The correct answer is C.

Although the term "triangulation" is probably most associated with Bowen, Minuchin and other family therapists also use this term. Even if you are unfamiliar with Minuchin's use of this term, knowing that he focuses on boundary disturbances and emphasizes the role of stress in family dysfunction would have helped you pick this as the correct response. As noted in the Clinical Psychology chapter of the written study materials, Minuchin describes several types of rigid triads (triangles) that all serve to reduce conflict and stress - i.e., triangulation, detouring, and stable coalition.

Answer A: Triangulation is not a positive indicator.

Answer B: Triangulation does not improve communication.

Answer D: This does not define triangulation.

Question 129

Not answered

Marked out of 1.00

Question ID #12845: Structured direct observations are most appropriate when:

Select one:

- ☐ A. standardized information needs to be gathered, and result in quantitative data
- ☐ B. looking at natural occurrences, and collecting qualitative data
- ☐ C. standardized information needs to be gathered, and result in qualitative data
- ☐ D. looking at natural occurrences, and disseminating qualitative data

The correct answer is A.

Direct Observation, also known as "observational study", is a method of collecting evaluative information in which the evaluator watches the participant in their usual environment without altering that environment. Direct observation is used when other data collection procedures, such as surveys and questionnaires are not effective. Structured direct observations are most appropriate when standardized information needs to be gathered, and result in quantitative data.

Answer B: This is not a form of direct observation.

Answer C: This response refers to unstructured direct observation.

Answer D: This is not a form of direct observation.

Question 130

Marked out of 1.00

Question ID #10750: The General Principles are aspirational in nature meaning that they are _____.

Select one:

- ☐ A. designed to guide psychologists with broadly phrased ideals
- ☐ B. principles that define right and wrong behavior on the part of psychologists
- ☐ C. ethical principles with explicit interpretations
- ☐ D. often used as a basis for imposing sanctions

The correct answer is A.

The General Principles, as opposed to Ethical Standards, "...guide and inspire psychologists toward the very highest ethical ideals of the profession."

Answer B: The General Principles do not define right and wrong behavior.

Answer C: This answer is incorrect. The General Principles are vague and overarching rather than explicit in their meaning.

Answer D: The General Principles should not be used as a basis for imposing sanctions.

Question 131

Not answered

Marked out of 1.00

Question ID #12048: Whether a certain trait or characteristic is expressed or exists is partly due to genetics and partly shaped by_____.

Select one:

- ☐ A. chance or luck
- ☐ B. life experiences
- ☐ C. race
- ☐ D. gender

The correct answer is B.

Epigenetics emphasizes the interaction of genes and the environment. In other words, whether or not a certain trait or characteristic is expressed is in part due to genetics and partly shaped through life experiences.

Answer A: Luck or chance does not play a role in whether a certain trait or characteristic is expressed.

Answer C: While one's race may shape how they experience the world and how their world impacts them, this is not the determining factor in gene expression.

Answer D: While one's gender may play a role in how an individual experiences the world and how their world impacts them, this is not the determining factor in gene expression.

Question 132

Not answered

Marked out of 1.00

Question ID #14413: Constructional apraxia is caused by damage to the:

Select one:

- ☐ A. temporal lobe.
- ☐ B. corpus callosum.
- ☐ C. basal ganglia.
- ☐ D. parietal lobe.

The correct answer is D.

Constructional apraxia is characterized by an inability to copy or draw figures or to arrange blocks in a pattern. Apraxia involves an ability to perform skilled movements that are not due to muscle weakness, sensory loss, general intellectual deterioration, or lack of cooperation. Most forms of apraxia (including constructional apraxia) are caused by damage to the parietal lobe.

Answer A: The temporal lobes contain the auditory cortex, Wernicke's area (important for the comprehension of language), and are involved in the encoding, retrieval, and storage of long-term memories.

Answer B: The corpus callosum is a large bundle of axons that connects the right and left hemispheres of the cerebral cortex and has not been identified as a structure involved in the etiology of the disorders listed in the question.

Answer C: The basal ganglia are involved in planning, organizing, and coordinating voluntary movements and regulating the amplitude and direction of motor neurons.

Question 133

Not answered

Marked out of 1.00

Question ID #12842: You begin a walk-in appointment with a 25-year-old graduate student who self-identifies as a bisexual, Latina, cisgender female. She presents to your office endorsing several weeks of depressed mood, anhedonia, insomnia, and morbid thoughts. When you query her about the morbid thoughts, she reports that she recently was diagnosed with cancer, which has led to panic attacks as she considers her impending death. She states that she is certain her condition will not improve and she can no longer tolerate the pain. Knowing that you only have a few minutes more with her, which assessment would you administer?

Select one:

- ☐ A. The Beck Depression Inventory-II
- ☐ B. The Beck Hopelessness Scale
- ☐ C. The Beck Scale for Suicidal Ideation
- ☐ D. A Structured Interview

The correct answer is C.

The Beck Scale for Suicidal Ideation consists of 21 items that describes various aspects of suicidal ideation (e.g., suicidal plans, deterrents to suicide, attitudes toward suicide) which the examinee rates in terms of severity. While the client appears to be experiencing symptoms of depression and anxiety, she also appears to be experiencing suicidal ideation. In general, risk of harm to self, others, and the general public is a priority to assess before the end of first session. Out of the choices given, a clinician would most benefit from utilizing the Beck Scale for Suicidal Ideation because it assesses various aspects of suicidal ideation that influence severity of risk and can be administered quickly.

Answer A: The Beck Depression Inventory-II consists of 21 items that address the mood, cognitive, behavioral, and physical aspects of depression. While the Beck Depression Inventory can be quickly administered and assesses the presence of suicidal ideation, it does not provide a thorough assessment of suicide risk.

Answer B: The Beck Hopelessness Scale was based on research showing that hopelessness is an accurate predictor of suicidal ideation and behavior. It contains 20 true-false items that assess the person's negative beliefs about the future. While the measure would give insight into the client's experience of hopelessness, it would not provide clarity regarding the severity of the client's current suicide risk.

Answer D: Structured interviews are data collection methods that typically involve a fixed number of close-ended questions. While you would be able to further assess the client's previously endorsed symptoms as well as assess for suicidal ideation and severity of risk, the measure could be very time consuming.

Question 134

Not answered

Marked out of 1.00

Question ID #13463: People who are diagnosed with Dissociative Identity Disorder:

Select one:

- ☐ A. experience a sense of unreality, detachment or being an outside observer of one's thoughts, feelings, and actions
- ☐ B. experience a sense of unreality or detachment regarding one's surroundings
- ☐ C. are typically aware of their symptoms as they do not cause impairment in functioning
- ☐ D. typically conceal or are unaware of their dissociative symptoms

The correct answer is D.

Individuals with a diagnosis of Dissociative Identity Disorder typically conceal or are unaware of their dissociative symptoms.

Answer A: This describes depersonalization, not Dissociative Identity Disorder.

Answer B: This describes derealization, not Dissociative Identity Disorder.

Answer C: Individuals with this diagnosis are typically unaware of their symptoms, and symptoms cause significant distress or impaired functioning.

Question 135

Not answered

Marked out of 1.00

Question ID #12913: A teacher is interested in whether the level of test anxiety (low, medium, or high) impacts students' exam performance, measured on a continuous scale of 0-100. The appropriate test for this instance is_____.

Select one:

- ☐ A. a one-sample t-test
- ☐ B. a one-sample chi-square test
- ☐ C. the Kruskal-Wallis test
- ☐ D. the Wilcoxon Signed-Rank test

The correct answer is C.

The Kruskal-Wallis test is a rank-based nonparametric test that can be used to determine if there are statistically significant differences between two or more groups of an independent variable on a continuous or ordinal dependent variable. In this example, level of anxiety is the IV with 3 levels measured on a nominal scale and the DV is the students' exam performance measured on a continuous 0-100 scale.

Answer A: A one-sample t-test is used to compare data collected on a sample to a known population mean.

Answer B: The chi-square test is a nonparametric statistical test used with nominal data or data being treated as nominal data and is used when the study includes one variable.

Answer D: The Wilcoxon test is used when a study includes two correlated (matched) groups and the scores on the DV for pairs of subjects are converted to ranks.

Question 136

Not answered

Marked out of 1.00

Question ID #13800: When conducting a functional behavioral analysis, you are interested in:

Select one:

- ☐ A. underlying motivations
- ☐ B. creating a behavior chain
- ☐ C. conditions that control a behavior
- ☐ D. program costs and benefits

The correct answer is C.

Functional behavioral analysis is also known as functional behavioral assessment. As its name implies, the analysis involves identifying the function (purpose) of a behavior. From the behavioral perspective, a behavior is controlled by its antecedents and consequences, and its function is defined in terms of those variables. A functional behavioral analysis is conducted to identify the antecedents and consequences that are contributing to or maintaining a behavior.

Answer A: Underlying motivations do not fit the behavioral model.

Answer B: With operant conditioning, chaining is used to combine a sequence of responses in order to end up with a "behavior chain." Chaining does not involve examining the function of behaviors.

Answer D: Program costs and benefits are not relevant to functional analysis.

Question 137

Not answered

Marked out of 1.00

Question ID #12851: In which type of test is the assessment tailored to the individual examinee by choosing subsequent items based on the examinee's previous answers?

Select one:

- ☐ A. Dynamic assessment
- ☐ B. Computer adaptive testing
- ☐ C. Functional behavioral assessment
- ☐ D. Computer-assisted assessment

The correct answer is B.

Computers are used not only to administer tests but also provide scoring and interpretation of test results. With regard to administration, computer-assisted test administration can act as an alternative to standard testing or provide adaptive testing. When using computer adaptive testing (CAT), the computer tailors the test to an individual examinee by choosing subsequent items based on the examinee's previous answers. The primary advantages of CAT are its precision and efficiency.

Answer A: Dynamic assessment involves an interactive approach and deliberate deviation from standardized testing procedures to obtain additional information about the examinee and/or determine if the examinee is likely to benefit from assistance or instruction.

Answer C: Functional behavioral assessment refers to a type of behavioral assessment that entails determining the function or purpose of a behavior by identifying its antecedents and consequences.

Answer D: Computer adaptive testing is a type of computer-assisted assessment. As computer adaptive testing is a more specific response, computer-assisted assessment is not the BEST response.

Question 138

Not answered

Marked out of 1.00

Question ID #14414: Damage to the portion of the left frontal lobe known as Broca's area is most likely to impair:

Select one:

- ☐ A. word recognition.
- ☐ B. verbal comprehension.
- ☐ C. verbal learning.
- ☐ D. speech production.

The correct answer is D.

Damage to Broca's area impacts speech production, as individuals with this disorder may speak slowly and with great difficulty, poorly articulate their speech, omit parts of speech, exhibit anomia, and have difficulty repeating phrases.

Answer A: Individuals with damage to Broca's area retain the ability to recognize words, although their verbal production is impaired.

Answer B: People with Broca's aphasia typically retain some verbal comprehension abilities.

Answer C: Damage to Broca's area will impair production of speech, but the ability to engage in some verbal learning remains intact.

Question 139

Not answered

Marked out of 1.00

Question ID #14405: _____ is characterized by the inability to carry out a simple motor activity in response to a verbal command.

Select one:

- ☐ A. ideational apraxia
- ☐ B. avolition
- ☐ C. ideomotor apraxia
- ☐ D. paraplegia

The correct answer is C.

Ideomotor apraxia is characterized by the inability to carry out a simple motor activity, either in response to verbal command (e.g., smile) or copying someone else's gesture, even though this same activity is readily performed spontaneously.

Answer A: Ideational apraxia is an impairment in carrying out a sequence of actions, although each step can be done correctly. Patients with this type of apraxia have difficulty carrying out instructions for a sequence of acts, but they can do each of these tasks in isolation.

Answer B: Avolition refers to restricted initiation of goal-directed behavior, or the lack of motivation to initiate self-directed behaviors.

Answer D: Paraplegia is a loss of sensory and voluntary functioning in both legs due to damage at the thoracic level. Paraplegia can be complete or partial paralysis of the lower half of the body.

Question 140

Not answered

Marked out of 1.00

Question ID #12717: You conduct a research study to assess the effects of T.V. violence on aggressive behavior. The study will take place over three consecutive weeks. During the first week, you will observe 20 children during recess for five consecutive days and calculate their average number of aggressive acts. During the second week, you will have all children observe aggressive T.V. programs for two hours on three separate days. Then, during the third week, you will again observe the children during recess for five days and calculate their average number of aggressive acts. The biggest threat to the internal validity of this study is:

Select one:

- ☐ A. carryover effects
- ☐ B. statistical regression
- ☐ C. selection
- ☐ D. history

The correct answer is D.

In any single-group design involving a before and after comparison, change in status on the DV might be due to the intervention or to an external event that occurred at about the same time the intervention was applied. In other words, the study's internal validity is threatened by history.

Answer A: Carryover effects are a problem when two or more levels of an IV are applied to the same participants.

Answer B: Statistical regression is a problem when the group or groups have been selected because of their extreme status on the DV or a related variable, which is not the case in this study.

Answer C: Selection is a problem in between-groups studies when participants cannot be randomly assigned to the different groups. This is a within-subjects study, so selection is not a threat.

Question 141

Not answered

Marked out of 1.00

Question ID #11854: Brittany is an anxious woman. Her partner, Scott, is an avoidant man. When Brittany seeks reassurance and asks Scott if he is happy with their marriage, Scott is most likely to react with ____.

Select one:

- ☐ A. compassion and love
- ☐ B. mild annoyance
- ☐ C. understanding of his wife's insecurities
- ☐ D. frustration; he needs distance in the relationship

The correct answer is D.

Because Scott has an avoidant attachment, he will meet Brittany's attempts to seek comfort with impatience and pull further away from her. Scott needs space in his relationship because his model for relationships growing up is centered around distance, avoidance, and a lack of warmth and comfort.

Answer A: This is most characteristic of someone with a secure attachment.

Answer B: While Scott may be annoyed with this question, he is also in need of space. Based on the options provided, this would not be the best response.

Answer C: This is most characteristic of someone with a secure attachment.

Question 142

Not answered

Marked out of 1.00

Question ID #11744: Kristen's parents give her anything she wants and do not expect anything from her in return. They tried to involve her in the family chores, but she just ignores them. Which of Diana Baumrind's parenting styles are Kristen's parents most likely using?

Select one:

- ☐ A. Incompetent
- ☐ B. Authoritative
- ☐ C. Authoritarian
- ☐ D. Indulgent

The correct answer is D.

Permissive (indulgent) parents are warm and caring but make few demands and are nonpunitive. They allow their children to make their own decisions about what chores to complete, when to go to bed, etc. The children of these parents tend to be immature, impulsive, self-centered, easily frustrated, and low in achievement and independence.

Answer A: This is not a parenting style described by Baumrind.

Answer B: Authoritative parents combine rational control with responsivity. Although they set clear rules and high standards for their children, they rely on reasoning, praise, explanations, and other inductive techniques to gain compliance, and they encourage independence.

Answer C: Authoritarian parents exhibit a high degree of demandingness and low responsivity. They impose absolute standards of conduct, stress obedience, and use physical punishment, threats, deprivation, and other power assertive techniques to gain compliance.

Question 143

Not answered

Marked out of 1.00

Question ID #13145: In vivo exposure with response prevention has been found to be an effective treatment for Agoraphobia, Obsessive-Compulsive Disorder, and several other anxiety disorders. Studies investigating the effects of this treatment for this suggest that:

Select one:

- ☐ A. frequent, brief exposures are more effective than less frequent, longer exposures to the feared stimuli
- ☐ B. people with high arousability are more responsive to in vivo treatments than people with low arousability
- ☐ C. high anxiety provocation is not the key factor in its effectiveness
- ☐ D. counterconditioning is a necessary component of treatment

The correct answer is C.

The goal of in vivo exposure is to extinguish the classically conditioned response by repeatedly exposing the person to the CS without the US. As noted in the Learning Theory chapter of the written study materials, there is evidence that high anxiety arousal is NOT necessary for successful treatment with in vivo exposure.

Answer A: This is the opposite of what has been found to be true.

Answer B: Arousability has been linked to the effects of systematic desensitization, not in vivo exposure. Systematic desensitization is usually more successful for individuals low in arousability than for those high in arousability.

Answer D: Counterconditioning is not a component of in vivo exposure.

Question 144

Question ID #13538: Lazarus and Folkman's (1984) transactional model of stress distinguishes between three types of cognitive appraisal. Primary appraisal refers to:

Select one:

- ☐ A. a person's initial evaluation of the intensity of the threatening situation
- ☐ B. a person's evaluation of the relevance of a potentially stressful event to his or her well-being
- ☐ C. a person's evaluation of whether his or her resources and abilities are sufficient to adequately cope with a threatening situation
- ☐ D. a person's continuous monitoring of a situation and use of new information

The correct answer is B.

Lazarus and Folkman's (1984) transactional model of stress distinguishes between three types of cognitive appraisal: primary appraisal, secondary appraisal, and cognitive reappraisal. Primary appraisal refers to a person's evaluation of the relevance of a potentially stressful event to his or her well-being.

Answer A: This is not one of the types of cognitive appraisal included in the transactional model of stress.

Answer C: This response describes secondary appraisal.

Answer D: This answer describes cognitive reappraisal.

Question 145

Marked out of 1.00

Question ID #13358: Which of the following is an example of a criterion-referenced score?

Select one:

- ☐ A. An examinee received a T-score of 65.
- ☐ B. An examinee answered 87% of the items on the test correctly.
- ☐ C. The student ranked at the 60th percentile on the college entrance exam.
- ☐ D. The student's score was above average for her class.

The correct answer is B.

Criterion-referenced interpretation involves interpreting scores in terms of a prespecified standard. A percentage score is a type of criterion-referenced score and reflects the proportion of the test content that an examinee answers correctly.

Answer A: A T-score is a type of standard score, and standard scores are norm-referenced scores that indicate how well an examinee did in terms of standard deviation units from the mean score of the norm group.

Answer C: Percentile ranks are also norm-referenced scores. A percentile rank indicates the percent of examinees in the norm group who obtained a lower score. In this example, 60% of the examinees scored lower on the college entrance exam than the student.

Answer D: This is another example of a norm-referenced interpretation, as the student's test score is compared to scores obtained by other students in her class (the normative sample). The student's score is above average in her class; however, her score may be considered average or below average if the normative sample were to change.

Question 146

Marked out of 1.00

Question ID #11020: Which of the following types of memory refers to general knowledge and concepts that endows information with meaning, and ultimately assists individuals in complex cognitive processes such as recognizing objects and using language?

Select one:

- ☐ A. Semantic memory
- ☐ B. Procedural memory
- ☐ C. Implicit memory
- ☐ D. Nondeclarative memory

The correct answer is A.

Semantic memory includes general knowledge and is responsible for the storage of facts, rules, and concepts. For example, remembering the rules of conjugating irregular verbs helps with the use of language.

Answer B: Procedural memory stores information about how to do things and is used to acquire, retain, and employ perceptive, cognitive, and motor skills.

Answer C: Implicit memory refers to memories that are recalled without conscious effort. Procedural memories are usually implicit memories.

Answer D: Nondeclarative memory is another term used to refer to implicit memory, or memories that are recalled without conscious effort.

Question 147

Question ID #13416: Individuals diagnosed with a Specific Learning Disorder typically have an IQ:

Select one:

- ☐ A. in the average to above-average range
- ☐ B. in the below-average range
- ☐ C. in the below-average to average range
- ☐ D. in the above-average range

The correct answer is A.

Individuals with a Specific Learning Disorder typically have an IQ in the average to above-average range.

Answer B: Specific Learning Disorder is not associated with a below-average IQ.

Answer C: Individuals with a Specific Learning Disorder typically do not have IQ's that fall within the below-average range.

Answer D: Individuals with a Specific Learning Disorder typically evidence an IQ in the average to above-average range.

Question 148

Marked out of 1.00

Question ID #13845: In conflict resolution, the primary role of a mediator is to:

Select one:

- ☐ A. derive a workable solution to the problem that will be acceptable to all disputants
- ☐ B. have disputants offer solutions and then choose the best one him/herself
- ☐ C. help disputants consider alternative solutions to the problem
- ☐ D. act as a "go-between" by working with each disputant individually

The correct answer is C.

Mediators facilitate the conflict resolution process. While they may offer suggestions, they do not determine the solution to a problem. Disputants are often inflexible with regard to their own idea of the best solution to a problem, and an important task for a mediator is to increase disputants' flexibility regarding alternatives. One way to achieve this goal is to suggest alternatives.

Answers A & B: Mediators may offer suggestions; however, they allow the disputants to choose the solution.

Answer D: A mediator may do this initially when conflict and hostility are high, but it's only a temporary role and not a primary one.

Question 149

Question ID #14400: Which of the following is likely to be most involved in reducing migraine headaches?

Select one:

- ☐ A. hypothalamus
- ☐ B. reticular activation
- ☐ C. cingulate gyrus
- ☐ D. thermal biofeedback

The correct answer is D.

A combination of thermal biofeedback and autogenic training is useful for some migraine sufferers.

Answer A: The hypothalamus is involved in the translation of emotions into physical responses through its influence on the autonomic nervous system and the pituitary gland.

Answer B: The reticular activating system (RAS) is involved in wakefulness, arousal, and consciousness.

Answer C: The cingulate gyrus helps regulate emotions and pain.

Question 150

Marked out of 1.00

Question ID #11710: Adrianna is 3 years old. According to Piaget, what stage of Cognitive Development is Adrianna most likely experiencing?

Select one:

- ☐ A. Sensorimotor
- ☐ B. Preoperational
- ☐ C. Concrete operational
- ☐ D. Formal operational

The correct answer is B.

The preoperational stage occurs from ages 2-7, and is characterized by the development of the symbolic (semiotic) function, which is an extension of representational thought and permits the child to learn through the use of language, mental images, and other symbols.

Answer A: The sensorimotor stage occurs from birth-2 years and involves the child learning about objects and other people through engaging with them and taking in sensory information from these interactions.

Answer C: In the concrete operational stage, typically occurring from ages 7 to 11, children are capable of mental operations, which are logical rules for transforming and manipulating information.

Answer D: The formal operational stage (age 11+) the youth is able to think abstractly and is capable of hypothetico-deductive reasoning.

Question 151

Not answered

Marked out of 1.00

Question ID #13353: When a newly developed test consists of 100 true/false items, the _____ can be used as an alternative to coefficient alpha for evaluating its internal consistency reliability.

Select one:

- ☐ A. Spearman-Brown formula
- ☐ B. coefficient of concordance
- ☐ C. Cohen's kappa statistic
- ☐ D. Kuder-Richardson Formula 20

The correct answer is D.

Kuder-Richardson Formula 20 (KR-20) is an alternative to coefficient alpha when items are scored dichotomously (right or wrong), which would be the case for true/false items.

Answer A: The Spearman-Brown formula is used to determine the impact of lengthening a test on its reliability.

Answer B: The coefficient of concordance is a measure of inter-rater reliability for three or more raters when ratings are ranks.

Answer C: Cohen's kappa statistic is used to measure inter-rater reliability and corrects for chance agreement.

Question 152

Not answered

Marked out of 1.00

Question ID #12919: The underlying logic of the factorial ANOVA is basically the same as that for the one-way ANOVA. The difference is that_____.

Select one:

- ☐ A. the one-way ANOVA is used when the DV is on an interval scale and a factorial ANOVA is used when the DV is on an interval OR ratio scale
- ☐ B. with a factorial ANOVA, the variability is partitioned so that F-ratios are obtained for the main effects of each IV and their interaction(s)
- ☐ C. the factorial ANOVA is less sensitive to sample size and homogeneous samples
- ☐ D. the ANOVA calculates an F-Ratio for two IVs and the factorial ANOVA calculates an F-ratio for more than two IVs

The correct answer is B.

The underlying logic of a factorial ANOVA is that variability between groups is "partitioned" even further than a one-way ANOVA so that F-ratios are obtained for the main effects of each IV and their interaction(s). With the one-way ANOVA, we only calculate variability for the main groups.

Answer A: Both the one-way and the factorial ANOVAs are appropriate for DVs on an interval OR ratio scale. The number of IVs will be a determining factor for whether a one-way ANOVA (one IV; two or more independent groups) or a factorial ANOVA (two or more IVs; independent groups) is used.

Answer C: This is not a distinguishing factor between one-way and factorial ANOVAs, and both types of ANOVA are held to the same assumptions for normality, homogeneity, etc.

Answer D: The one-way ANOVA is used when there is one independent variable, not two or more. When a study includes two or more independent variables, a factorial ANOVA is more appropriate.

Question 153

Not answered

Marked out of 1.00

Question ID #13230: The primary difference between the diagnoses of Somatic Symptom Disorder and Illness Anxiety Disorder is:

Select one:

- ☐ A. a high level of anxiety about health
- ☐ B. symptom duration
- ☐ C. the presence of somatic symptoms
- ☐ D. level of functional impairment

The correct answer is C.

The primary difference between the diagnoses of Somatic Symptom Disorder and Illness Anxiety Disorder is the presence of somatic symptoms. For a diagnosis of Somatic Symptom Disorder, the individual experiences one or more somatic symptoms. In contrast, somatic symptoms are not present, or if present, are only mild in intensity in Illness Anxiety Disorder.

Answer A: Both diagnoses involve a high level of anxiety about health or symptoms.

Answer B: Symptom duration for both disorders is six months.

Answer D: Level of functional impairment does not distinguish between Somatic Symptom Disorder and Illness Anxiety Disorder.

Question 154

Not answered

Marked out of 1.00

Question ID #11903: Ian's parents never discuss their rules. If they set a boundary, and he asks why, they say, "Because I said so; that's why." According to Baumrind, what style of parenting are Ian's parents most likely using?

Select one:

- ☐ A. Authoritarian
- ☐ B. Authoritative
- ☐ C. Neglectful
- ☐ D. Indulgent

The correct answer is A.

Authoritarian parents exhibit a high degree of demandingness and low responsivity. They impose absolute standards of conduct, stress obedience, and use physical punishment, threats, deprivation, and other power assertive techniques to gain compliance.

Answer B: Authoritative parents combine rational control with responsivity. Although they set clear rules and high standards for their children, they rely on reasoning, praise, explanations, and other inductive techniques to gain compliance, and they encourage independence.

Answer C: Rejecting-neglecting (uninvolved) parents exhibit low levels of responsivity and demandingness, and they may be overtly hostile toward their children.

Answer D: Permissive (indulgent) parents are warm and caring but make few demands and are nonpunitive. They allow their children to make their own decisions about what chores to complete, when to go to bed, etc.

Question 155

Not answered

Marked out of 1.00

Question ID #13959: When treating an 8-year old child who doesn't like going to bed at night because he's afraid of the dark, which of the following interventions would Graziano and Mooney (1984) recommend?

Select one:

- ☐ A. A social skills technique that relies on modeling with guided participation and behavioral rehearsal
- ☐ B. A cognitive self-control technique that incorporates visual imagery and positive self-statements
- ☐ C. A behavioral technique that includes flooding (in vivo exposure with response prevention)
- ☐ D. A behavioral technique that includes systematic desensitization

The correct answer is B.

In general, behavioral and cognitive-behavioral techniques have been found most effective for alleviating phobias in both children and adults. Unfortunately, knowing this doesn't help with this question since all of the techniques listed fall into this category. Considering the boy's age may have helped you eliminate at least two of the answers (c and d). This technique has been described by A. M. Graziano and K. C. Mooney (Children and Behavior Therapy, New York, Aldine, 1984), who found it to be an effective treatment for children who fear the dark. Cognitive self-control involves several steps: At bedtime, the child first relaxes, then visualizes a pleasant scene, and then makes self-statements such as "I am brave. I can take care of myself in the dark." This technique is considered a self-control technique since it is administered by the child him/herself (although the parents are also involved in reminding the child to use the technique and in monitoring the child's progress).

Answer A: Participant modeling has been found to be more useful for childhood phobias involving animals and dental and medical procedures.

Answer C: The use of flooding with children is controversial and is not considered a treatment-of-choice by most authorities.

Answer D: Systematic desensitization has generally not been found to be particularly effective with children (see Graziano and Mooney for a review of the literature).

Question 156

Not answered

Marked out of 1.00

Question ID #12917: A teacher wants to evaluate a new method for teaching math. They give their group of students a math test and obtain the scores. Afterwards, the teacher introduces the students to the new method of analyzing the math problems. The teacher then re-tests all the students to see if the method led to improved scores. In this example, the appropriate statistical test would be_____.

Select one:

- ☐ A. matched-pairs t-test
- ☐ B. independent samples t-test
- ☐ C. two-sample chi-square test
- ☐ D. Kruskal-Wallis test

The correct answer is A.

A matched-pairs t-test is used to compare data from the same subjects under different conditions.

Answer B: The t-test for independent samples is used to compare means from two independent groups. In this scenario, data collected for baseline and treatments phases are on the same group of students.

Answer C: The multiple-sample chi-square test is used when a descriptive or experimental study includes two or more variables and the data to be analyzed are measured on a nominal scale.

Answer D: The Kruskal-Wallis can be used when a study includes two or more independent groups and the data to be analyzed are ranks.

Question 157

Not answered

Marked out of 1.00

Question ID #12918: A researcher tests the hypothesis that a study skills training program increases academic achievement by training a random sample of 22 college freshmen who the academic program has identified as low academic performers. Following training the researcher administered a test of academic achievement. What statistical test would the researcher use to compare the mean achievement test score obtained by students in the sample to the mean score for the population of college freshmen that are identified as low academic performers?

Select one:

- ☐ A. Mann-Whitney U Test
- ☐ B. Student's t-Test for Correlated Samples
- ☐ C. Single Sample Chi-square test
- ☐ D. Student's t-Test for a Single Sample

The correct answer is D.

In the scenario described, a researcher is comparing an obtained sample mean to a known population mean. The student's t-test for single samples is the statistical test used when a study includes only one group and the sample mean will be compared to a known population mean. In this situation, the population is acting as a no-treatment control group.

Answer A: The Mann Whitney U is the nonparametric alternative to a t-test of independent samples and is appropriate when a study includes two independent groups and data on the dependent variable are reported in terms of ranks. The data in this scenario are continuous, so a parametric test is more appropriate, there is only one group, and the researcher is comparing a sample mean to a known population mean, so the student's t-test for single samples is most appropriate.

Answer B: The t-test for correlated (related) samples is used when the two means to be compared have come from correlated groups. It is the appropriate test for a study using a within-subjects design in which a single group of subjects will be compared to itself before and after the IV has been applied.

Answer C: The chi-square test is a nonparametric statistical test used with nominal data (or data that are being treated as nominal data) and is used when the study includes one variable. This study involves comparing a sample mean to a known population mean for scores obtained on an achievement test which are continuous data.

Question 158

Question ID #13796: Divergent thinking is associated with which of the following?

Select one:

- ☐ A. Practical intelligence
- ☐ B. Creativity
- ☐ C. Neuroticism
- ☐ D. Crystallized intelligence

The correct answer is B.

Divergent thinking refers to the ability to think flexibly and consider a wide range of solutions. Creativity involves a number of attributes including divergent thinking, open-mindedness, unconventionality, and willingness to take risks.

Answer A: Sternberg distinguishes between three types of intelligence - analytic, creative, and practical. Divergent thinking is most associated with creative thinking, not practical intelligence.

Answer C: Neuroticism has not been associated with divergent thinking.

Answer D: Convergent (rather than divergent) thinking is associated with crystallized intelligence.

Question 159

Not answered

Marked out of 1.00

Question ID #12982: Lithium is often the treatment-of-choice for mania, with the research indicating that 80% of patients have a favorable response to it. In recent years, however, there has been increasing interest in prescribing _____, which seem to be as effective as lithium for controlling acute manic states and stabilizing mood.

Select one:

- ☐ A. SSRIs
- ☐ B. antipsychotic drugs
- ☐ C. benzodiazepines
- ☐ D. anticonvulsant medications

The correct answer is D.

Although lithium has been the standard treatment for Bipolar Disorder to reduce mania and mood fluctuations, alternative drugs have been found to be similarly effective. Of the drugs listed, only anticonvulsant drugs (especially carbamazepine and valproate) have been found to be comparable to lithium in their beneficial effects.

Answer A: SSRIs is incorrect. See explanation for answer D.

Answer B: Antipsychotic drugs is incorrect. See explanation for answer D.

Answer C: Benzodiazepines is incorrect. See explanation for answer D.

Question 160

Not answered

Marked out of 1.00

Question ID #12879: According to equity theory, a person in a relationship who feels under-rewarded will tend to:

Select one:

- ☐ A. give up on the relationship
- ☐ B. feel distress and attempt to restore balance or equity in the relationship
- ☐ C. focus on oneself
- ☐ D. become complacent

The correct answer is B.

Social equity theory is concerned with the fairness in the exchange of goods, services, time, and effort. Someone who feels under-rewarded will feel distress and attempt to restore equity in the relationship.

Answers A, C, and D: These answers are not predicted by social equity theory.

Question 161

Not answered

Marked out of 1.00

Question ID #13415: Disruptive Mood Dysregulation Disorder involves severe recurrent temper outbursts plus:

Select one:

- ☐ A. persistent verbal and physical aggression between temper outbursts
- ☐ B. a chronic, persistently irritable or angry mood between temper outbursts
- ☐ C. episodes of depressive symptoms between temper outbursts
- ☐ D. episodes of abnormally elevated mood between temper outbursts

The correct answer is B.

Disruptive Mood Dysregulation Disorder involves severe recurrent temper outbursts manifested verbally and/or behaviorally, and a chronic, persistently irritable or angry mood between temper outbursts on most days.

Answers A, C, and D: These responses are incorrect as this diagnosis requires a persistently irritable mood between temper outbursts.

Question 162

Not answered

Marked out of 1.00

Question ID #13907: When using the Premack principle to increase a desirable behavior, the reinforcer is:

Select one:

- ☐ A. a stimulus that naturally elicits the target behavior
- ☐ B. a stimulus that can be applied intermittently following the target behavior
- ☐ C. a generalized conditioned reinforcer
- ☐ D. a high probability behavior

The correct answer is D.

The Premack principle is an application of positive reinforcement. When using the Premack principle, a high probability behavior is used to reinforce a low probability behavior in order to increase the frequency of the low probability behavior. It is also known as "Grandma's Rule" (e.g., "you can go out and play [a highly desired behavior] once you've cleaned your room [a less desired behavior].").

Answer A: The reinforcer only elicits the desired behavior because it is contingent upon the desired behavior being performed (e.g., a student studies for an hour because only then are they permitted to play video games).

Answer B: The reinforcer (i.e., the high-frequency, desirable behavior) must be applied consistently.

Answer C: The reinforcer is a naturally-reinforcing behavior, not conditioned.

Question 163

Not answered

Marked out of 1.00

Question ID #13824: Microaggressions may present as all of the following except:

Select one:

- ☐ A. Microassaults
- ☐ B. Micro-inequalities
- ☐ C. Microinvalidations
- ☐ D. Microinsults

The correct answer is B.

Microassaults, microinsults, and microinvalidations are the three forms of microaggression described by D. W. Sue et al. (Racial microaggressions in everyday life: Implications for clinical practice, American Psychologist, 62, 271-286, 2007). Micro-inequalities is not an established form of microaggression.

Answer A: Microassaults are "explicit racial derogations characterized primarily by a violent verbal or nonverbal attack meant to hurt the intended victim through name-calling, avoidant behavior or purposeful discriminatory actions" (p. 278).

Answer C: Microinvalidation refers to "verbal comments or behaviors that exclude, negate, or nullify the psychological thoughts, feelings, or experiential reality of a person of color" (p. 278). "Color blindness" is a type of microinvalidation.

Answer D: Microinsults are "remarks or comments that convey rudeness, insensitivity and demean a person's racial heritage or identity" (p. 278).

Question 164

Not answered

Marked out of 1.00

Question ID #14397: Absence (petit mal) seizures appear to have their origin in which area of the brain?

Select one:

- ☐ A. motor cortex
- ☐ B. thalamus
- ☐ C. occipital lobe
- ☐ D. amygdala

The correct answer is B.

Absence seizures are characterized by an altered level of consciousness without significant motor symptoms. Research with animals and humans indicates that petit mal seizures begin in the thalamus, which is considered the "gateway to consciousness." Research with rats has linked an overabundance of GABA receptors in the thalamus to petit mal seizures.

Answers A, C, & D: There is some evidence that the thalamus plays a role in the generation of absence seizures (e.g. Salek-Haddadi et al., 2003).

Question 165

Not answered

Marked out of 1.00

Question ID #13940: When treating a patient with Delirium, a priority is to identify and then treat or remove its cause. In addition, it is important to:

Select one:

- ☐ A. make sure that the patient is provided with adequate stimulation
- ☐ B. keep the patient in a quiet room where he/she can be monitored by a family or staff member
- ☐ C. administer a neuroleptic to reduce the patient's disorientation and agitation
- ☐ D. make sure family members and friends visit regularly

The correct answer is B.

Delirium is characterized by disorientation and confusion, so an important goal is to provide an environment that decreases disorientation. For example, it is important to reduce distractions and to provide a quiet, well-lit room and constant monitoring.

Answer A: Although "adequate stimulation" could be taken to mean stimulation that is appropriate for a disoriented state, this response is not the best answer as it is too vague.

Answer C: Neuroleptics may or may not be appropriate, depending on the cause of the Delirium.

Answer D: With a delirious patient, you want to provide a consistent environment, so regular visits by different people would probably be contraindicated.

Question 166

Not answered

Marked out of 1.00

Question ID #10749: If a psychologist loses his or her professional license as a result of misconduct, APA may ____.

Select one:

- ☐ A. not take further action given a psychologist cannot be subjected to "double jeopardy"
- ☐ B. take action against that psychologist if she or he is a member of APA
- ☐ C. take action against that psychologist whether or not she or he is a member of APA
- ☐ D. not take further action unless the psychologist, whether a member or nonmember, is granted an in-person hearing

The correct answer is B.

The APA's Ethics Code specifies the APA may take action against a member after "his or her conviction of a felony, expulsion or suspension from an affiliated state psychological association, or suspension or loss of licensure."

Answer A: This answer is incorrect. "Double jeopardy" does not apply.

Answer C: The APA does not take action against psychologists who are not members.

Answer D: This answer is incorrect. "...the 2001 Rules and Procedures do not guarantee an opportunity for an in-person hearing" when the sanction is less than expulsion, however, this answer is incorrect because it includes nonmembers of APA.

Question 167

Not answered

Marked out of 1.00

Question ID #13449: The essential features of Anorexia Nervosa include:

Select one:

- ☐ A. restriction of energy, intense fear of gaining weight, and a disturbance in body weight perception
- ☐ B. excessive dieting, lower-than-normal body weight, and preoccupation with a distorted body image
- ☐ C. recurrent episodes of binge eating, inappropriate compensatory behavior, and self-evaluation that is overly influenced by body image
- ☐ D. excessive dieting, preoccupation with body image, and a lower-than-normal body weight

The correct answer is A.

The essential features of Anorexia include restriction of energy, intense fear of gaining weight or behavior that interferes with weight gain, and a disturbance in body weight perception, or a persistent lack of recognition of the seriousness of his or her low body weight.

Answers B and D: These responses are incorrect as they do not include the essential features of Anorexia Nervosa.

Answer C: This response more accurately describes the essential features of Bulimia Nervosa.

Question 168

Not answered

Marked out of 1.00

Question ID #12850: The Halstead-Reitan Neuropsychological Battery includes core tests that assess a variety of functions including:

Select one:

- ☐ A. memory, concentration, visual-motor integration, and manual dexterity
- ☐ B. concentration, auditory processing, visual-motor integration, and gross motor skills
- ☐ C. memory, cognitive shifting, gross motor skills, and manual dexterity
- ☐ D. memory, cognitive shifting, visual-motor integration, and manual dexterity

The correct answer is A.

The Halstead-Reitan (H-R) is used to detect the presence of brain damage and determine its severity and possible location in individuals ages 15 and older. The core tests included in the H-R were found to differentiate between normal controls and individuals with brain damage and assess a variety of functions including memory, concentration, abstract reasoning, language, visual-motor integration, and manual dexterity.

Answer B, C, and D: The core tests included in the H-R assess a variety of functions including memory, concentration, abstract reasoning, language, visual-motor integration, and manual dexterity.

Question 169

Marked out of 1.00

Question ID #11759: Ann Masten and colleagues found that emerging adults who overcame adversity and became competent adults had all of the following characteristics except_____.

Select one:

- ☐ A. they were intelligent
- ☐ B. they had high-quality parenting
- ☐ C. they were well-traveled
- ☐ D. they had a higher socioeconomic status

The correct answer is C.

Individuals demonstrating resiliency were intelligent, had high quality parenting, and came from a higher socioeconomic status. Whether they were well-traveled or not, did not play a role in their resilience.

Answer A: This was a characteristic found in Masten's research.

Answer B: This factor was found in Masten's resiliency research.

Answer D: Masten identified that individuals from a higher socioeconomic status were more resilient.

Question 170

Not answered

Marked out of 1.00

Question ID #12837: The PTA votes to remove certain controversial books from the school library. Even though these books had been rarely checked out by students prior to the vote, once the books have been removed, teachers notice that many of their students have purchased and are reading the books. The students' behavior is an example of:

Select one:

- ☐ A. cognitive dissonance
- ☐ B. psychological reactance
- ☐ C. the boomerang effect
- ☐ D. deindividuation

The correct answer is B.

In this situation, the students are doing the opposite of what the PTA members want them to do. Psychological reactance occurs when a person feels his or her personal freedom is being threatened and, as a result, does the opposite of what is required or requested.

Answer A: Cognitive dissonance refers to a state of discomfort that results when a person has inconsistent attitudes and behaviors.

Answer C: The boomerang effect refers specifically to attitude change and involves changing one's attitude in a way that is opposite to that contained in a persuasive communication. Because the boomerang effect refers to attitude change (rather than behavior change), answer B is a better response.

Answer D: Deindividuation occurs when a person feels anonymous because of his participation in a group. It can cause a person to act in uncharacteristic ways.

Question 171

Not answered

Marked out of 1.00

Question ID #10548: Jessica Perkins completed her Ph.D. in clinical psychology and has started a post-doc position in a university counseling center where she is accumulating supervised hours enabling her to sit for the EPPP and her state jurisprudence exam. When Jessica meets with a new client she should _____.

Select one:

- ☐ A. provide the name and contact information for her supervisor
- ☐ B. not introduce herself as "Dr. Perkins"
- ☐ C. explain what a postdoc entails and how it differs from an internship
- ☐ D. record her sessions so her supervisor can provide feedback

The correct answer is A.

Many states require supervised hours beyond the doctoral degree in order for trainees to become licensed. Because Dr. Perkins is under supervision as she accumulates hours toward licensure, she should provide her clients with the name and contact information of her supervisor.

Answer B: If Jessica has obtained her Ph.D. in clinical psychology she may ask her clients to use that title, but she should also explain her status as an unlicensed professional who is under supervision.

Answer C: This is not necessary.

Answer D: While recording her sessions is a good idea provided she has her clients' informed consent, recording is not required by the APA's Ethics Code.

Question 172

Not answered

Marked out of 1.00

Question ID #13355: A personnel director decides to raise a selection test's cutoff score when using the test to assist in hiring decisions. Most likely the personnel director has made this decision in order to:

Select one:

- ☐ A. increase the number of true positives
- ☐ B. decrease the number of false positives
- ☐ C. increase the number of false negatives
- ☐ D. decrease the number of true negatives

The correct answer is B.

A personnel director would most likely raise the predictor cutoff to decrease the number of false positives since these individuals would "cost the company money" (i.e., they would be hired on the basis of their test scores but would be unsuccessful on the job).

Answer A: Raising the predictor cutoff scores would decrease the number of true positives.

Answer C: Although raising the predictor cutoff score increases the number of false negatives, this would not be considered desirable in most situations. A personnel director would not want to increase the number of people who are rejected (not hired) on the basis of their selection test scores but would have been successful on the job if they had been hired.

Answer D: Raising the predictor cutoff increases the number of true negatives.

Question ID #13827: According to psychoanalytic theory, transference _____.

Select one:

- ☐ A. is a natural response to countertransference
- ☐ B. is a client's attempt to overcome resistance
- ☐ C. may foster a therapeutic alliance
- ☐ D. helps a client recognize and resolve unconscious conflicts

The correct answer is D.

Transference involves the development on the part of a client of feelings, attitudes, and defenses toward his/her therapist that represents a displacement of feelings toward significant people in the client's past. The analysis of transference helps a client recognize and resolve his/her unconscious conflicts.

Answer A: While both are associated with psychoanalysis, transference is not a response to countertransference. While Freud considered transference and its resolution to be desirable, he felt that countertransference (the therapist's feelings, attitudes, and defenses toward the client) should be avoided.

Answer B: Even though working through transference helps a client resolve unconscious conflicts, which he/she may resist acknowledging, psychoanalytic theory does not suggest what is stated here. Transference may occur when there is no resistance.

Answer C: Transference is not considered to be something that improves the therapeutic alliance but, rather, something that helps the client resolve his/her unconscious conflicts. An important goal of psychoanalysis is to work through transference.

Question 174

Marked out of 1.00

Question ID #11013: Which of the following describes the level of expected performance based on task difficulty and arousal level?

Select one:

- ☐ A. The Premack Principle
- ☐ B. The zone of proximal development
- ☐ C. The Yerkes-Dodson Law
- ☐ D. The James-Lange theory

The correct answer is C.

The Yerkes-Dodson Law specifically states that moderate levels of arousal maximize the efficiency of learning and performance, while extremely low and high levels are associated with decreased efficiency. Put another way, the relationship between arousal and learning assumes the shape of an inverted "U." The relationship between arousal and learning is also affected by task difficulty: usually the more difficult the task, the lower the optimal level of arousal.

Answer A: The Premack principle is a type of positive reinforcement in which a high frequency behavior is used as the reinforcer for a low frequency behavior.

Answer B: The zone of proximal development was coined by Vygotsky to describe the range of learning that includes what children can accomplish by themselves and what they can do with assistance from others (usually adults or experienced peers).

Answer D: The James-Lange Theory of emotion posits that emotions occur as a result of physiological reactions to external stimuli.

Question 175

Question ID #11730: A graduate teaching assistant gave a lecture on individual differences in adolescents' cognitive development. Which of the following information from the teaching assistant's lecture is not true?

Select one:

- ☐ A. "Most 8th graders are formal operational thinkers."
- ☐ B. "By late adolescence, many youth are using formal operational thought more than concrete operational thought."
- ☐ C. "There is great variation among adolescents in the use of formal operational thought."
- ☐ D. "The data on whether or not formal operational thought increases with age is inconclusive."

The correct answer is A.

This statement is false. Although skills associated with the formal operational stage can emerge as early as age 11, not everyone reaches this stage, and for those who do reach this stage, there is still great variation among adolescents using formal operational thought.

Answer B: This is a true statement. Later adolescent years and early young adulthood is characterized by more use of formal operational abilities.

Answer C: Because there are individual differences involved in adolescent growth and development, there is also great variation in the use of formal operational thought.

Answer D: It not clear whether people's skills in formal operational thought increases with age.

Question 176

Not answered

Marked out of 1.00

Question ID #12878: Research on the effects of crowding on behavior have shown that:

Select one:

- ☐ A. Women and men react differently to crowding under certain circumstances
- ☐ B. No differences between women and men have been found
- ☐ C. Research on crowding has not looked at gender differences
- ☐ D. Women always react more positively than men in crowded conditions

The correct answer is A.

Under certain conditions, women and men have been found to react differently to crowding situations.

Answers B, C, D: These answers do not reflect what research on crowding has shown regarding gender differences.

Question 177

Marked out of 1.00

Question ID #12840: Previous research on the Bender-Gestalt indicated that performance consistently is affected by:

Select one:

- ☐ A. personality
- ☐ B. drawing ability
- ☐ C. intelligence
- ☐ D. education

The correct answer is D.

The Bender Visual-Motor Gestalt Test, Second Edition (Bender-Gestalt II) is a brief measure of visual-motor integration for individuals ages 3 and older and is used as a measure of visual-motor development and screening tool for neuropsychological impairment. Research has indicated that performance on the measure is affected by education and that the measure is useful for assessing school readiness in first graders, predicting academic achievement, and identifying emotional problems and learning disabilities.

Answer A: The Bender-Gestalt is not considered to be accurate for identifying personality characteristics or for making psychiatric diagnoses.

Answer B: Research on the previous version of the Bender-Gestalt indicated that performance is affected by education but not by drawing ability.

Answer C: While research has shown that performance scores do correlate with intelligence, the correlation decreases significantly after age 10. In fact, after age 10, most individuals with average intelligence scores obtain perfect or near perfect scores on the Bender-Gestalt.

Question 178

Marked out of 1.00

Question ID #10751: The APA's Ethics Code violations may be enforced by _____.

Select one:

- ☐ A. the APA Ethics Committee only
- ☐ B. the aspirational principles
- ☐ C. Standards of Practice
- ☐ D. other professional groups and licensing boards

The correct answer is D.

The Introduction and Applicability section of the APA's Ethics Code states "Actions that violate the standards of the Ethics Code may also lead to the imposition of sanctions on psychologists or students whether or not they are APA members by bodies other than APA, including state psychological associations, other professional groups, psychology boards, other state or federal agencies, and payors for health services."

Answer A: The APA Ethics Committee is not the only entity who may issue sanctions based on violating the ethical responsibilities described in the Ethics Code.

Answer B: This answer is incorrect. The aspirational principles are broad statements intended to inspire psychologists to the highest principles. They are not applicable to this question.

Answer C: Standards of Practice are not applicable to this question.

Question 179

Marked out of 1.00

Question ID #10742: You are hired by a defense attorney as a consultant in a criminal case. You subsequently receive a subpoena from the prosecuting attorney, requesting that you serve as a fact witness at a deposition. You should _____.

Select one:

- ☐ A. refuse to act as a fact witness because doing so would involve you in a "multiple relationship"
- ☐ B. get permission from the defense attorney before appearing at the deposition
- ☐ C. clarify the expectations of both attorneys with regard to your roles before appearing at the deposition
- ☐ D. appear at the deposition but refuse to provide any information without a court order

The correct answer is C.

This issue is addressed in Standard 3.05(c) of the APA's Ethics Code and Principle I.26 of the Canadian Code of Ethics. Standard 3.05(c) recommends that psychologists avoid multiple relationships. However, it also states that, when psychologists are "to serve in more than one role in judicial or administrative proceedings, at the outset they clarify role expectations and the extent of confidentiality and thereafter as changes occur." In other words, it is acceptable to adopt dual roles in some situations. The acceptability of dual roles in legal proceedings when one role is a fact witness is addressed in the "Guidelines for Child Custody Evaluations in Divorce Proceedings."

Answer A: While psychologists want to avoid multiple relationships when possible, it is important to understand the exceptions to this general rule.

Answer B: This answer is incorrect. Rather than seeking permission, the psychologist should clarify role expectations with the parties involved.

Answer D: This answer is incorrect. See the explanation for Answer C.

Question 180

Not answered

Marked out of 1.00

Question ID #12903: An investigator wants to control for random error when designing their research study. Which of the following strategies would be most effective?

Select one:

- ☐ A. Conducting a true experiment to control experimental conditions and procedures
- ☐ B. Conducting a post hoc analysis on significant results to remove random error
- ☐ C. Conducting multiple studies so the random error can be identified and adjusted for
- ☐ D. Conducting statistical techniques, such as an ANCOVA, to control for random variables

The correct answer is A.

Experimental research helps the researcher minimize the effects of random error in subjects, procedures, and measuring instruments by allowing them to control experimental conditions and procedures.

Answer B: Conducting post-hoc analyses would not control for random error that has already been introduced during the study itself.

Answer C: Conducting multiple studies in hopes of identifying and accounting for random error as the studies progress is not the most effective way to control for random error. The best way to control for random error is through the use of a true experimental design.

Answer D: Conducting statistical techniques like an ANCOVA could control for an identified extraneous variable (a source of systematic error) by equalizing all subjects with regard to their status on that variable. However, it would not be the most effective method for addressing random error.

Marked out of 1.00

Question ID #11864: According to Bronfenbrenner, which of the following systems includes the culture in which people live?

Select one:

- ☐ A. Macrosystem
- ☐ B. Exosystem
- ☐ C. Mesosystem
- ☐ D. Chronosystem

The correct answer is A.

The macrosystem is comprised of such overarching environmental influences as cultural beliefs and practices, economic conditions, and political ideologies.

Answer B: The exosystem consists of elements in the broader environment that affect the child's immediate environment and includes the parents' workplace, the school board, community agencies, local industry, and the mass media.

Answer C: The mesosystem refers to interactions between components of the microsystem, such as the influence of family factors on the child's behavior at school.

Answer D: The chronosystem consists of environmental events occurring over an individual's lifespan and impact the individual in ways that depend on their circumstances and developmental stage.

Question 182

Not answered

Marked out of 1.00

Question ID #12906: The non-parametric alternative to the t-test for independent samples is the_____.

Select one:

- ☐ A. Kruskal-Wallis test
- ☐ B. Friedman test
- ☐ C. Wilcoxon Signed-Rank test
- ☐ D. Mann-Whitney test

The correct answer is D.

The Mann-Whitney U test is the nonparametric alternative to the t-test for independent samples. It is used to compare differences between two independent groups when the dependent variable is either ordinal or continuous, but not normally distributed.

Answer A: The Kruskal-Wallis test is the nonparametric alternative to the one-way ANOVA with one IV, with two or more independent groups.

Answer B: The Friedman test is the nonparametric alternative to the one-way ANOVA with repeated measures. It is used to test for differences between groups when the dependent variable being measured is ordinal.

Answer C: The Wilcoxon matched pairs or signed rank test is used when a study includes two correlated (matched) groups and the difference scores on the DV for pairs of subjects are converted to ranks. It is the nonparametric alternative to the t-test for correlated samples.

Question 183

Not answered

Marked out of 1.00

Question ID #10455: According to Bandura's (1986) social cognitive theory, most complex human behaviors are the result of:

Select one:

- ☐ A. latent learning
- ☐ B. generative learning
- ☐ C. vicarious learning
- ☐ D. insight learning

The correct answer is C.

In contrast to behavioral explanations that attribute learning to classical or operant conditioning, Bandura proposed that people acquire a behavior by observing another individual perform that behavior; that is, they learn vicariously.

Answer A: Tolman's model of latent learning proposes that learning can occur without reinforcement and without being manifested in performance improvement.

Answer B: Generative learning is one of several approaches to constructivism.

Answer D: Kohler proposed that learning can be the result of insight (an "aha" experience) that reflects an internal cognitive restructuring of the environment that allows the organism to achieve its goals.

Question 184

Not answered

Marked out of 1.00

Question ID #13936: Conceptual incarceration involves:

Select one:

- ☐ A. polarizing oneself into "good" and "bad" components
- ☐ B. mentally imprisoning oneself
- ☐ C. adopting a White, Anglo-Saxon Protestant worldview and lifestyle
- ☐ D. concealing anger or other unacceptable feelings by acting composed and calm

The correct answer is C.

Landrum and Batts (1985) hold that one of the many impacts of racial oppression may be the development of conceptual incarceration which involves the adoption of a White, Anglo-Saxon Protestant worldview and lifestyle.

Answer A: This partially defines the split-self syndrome.

Answer B: This does not describe conceptual incarceration.

Answer D: This describes playing it cool.

Question 185

Not answered

Marked out of 1.00

Question ID #12097: Dominique is the all-around champion on the high school gymnastics team and at the national level. Her father was a former gymnastics coach and her mother was also an award winning gymnast. According to the epigenetic view of development, Dominique's talent in gymnastics a result of ____.

Select one:

- ☐ A. a combination of heredity and environment
- ☐ B. her genetically inherited ability to execute aerials, tumbling, and floor routines with ease
- ☐ C. hard work and practice; genes have very little to do with her ability
- ☐ D. luck

The correct answer is A.

The epigenetic explanation describes the relationship between genetic and environmental influences as bidirectional and ongoing. From this perspective, each stage of development is affected by previous genetic, neural, behavioral, and environmental interactions and, in turn, affects future interactions.

Answer B: Epigenetics involves the interaction between genes and environment, but this answer only addresses genetically inherited ability.

Answer C: Epigenetics involves the interaction between genes and environment, but this answer only reflects the impact of environment.

Answer D: Epigenetics does not address the role of luck development.

Marked out of 1.00

Question ID #14409: _____ is a neuroleptic-induced movement disorder that is characterized by a subjective feeling of restlessness accompanied by stereotypical motor movements such as fidgeting, pacing, or foot tapping.

Select one:

- ☐ A. Dystonia
- ☐ B. Akathisia
- ☐ C. Akinesia
- ☐ D. Parkinsonism

The correct answer is B.

Akathisia usually develops within a few weeks after starting or increasing the dose of a neuroleptic drug. Akathisia is an extrapyramidal side effect of the neuroleptic drugs and a symptom of Parkinson's disease. It involves an unpleasant feeling of restlessness and need to move.

Answer A: Dystonia is characterized by abnormal and prolonged contraction of the muscles of the eyes, head, neck, limbs, or trunk.

Answer C: Akinesia is one of the symptoms of neuroleptic-induced parkinsonism and involves a slowing or lack of normal motor function.

Answer D: Parkinsonism is a term to describe the collection of symptoms of Parkinson's Disease. Parkinsonism involves tremor, muscle rigidity, and akinesia.

Question 187

Question ID #10554: According to HIPAA regulations, psychotherapy notes are _____.

Select one:

- ☐ A. required to obtain payment from insurance companies
- ☐ B. part of the clinical record that must be released to the client upon request
- ☐ C. kept separate from documentation required to provide treatment
- ☐ D. relevant to HIPAA only if they are released in an electronic form

The correct answer is C.

Under HIPAA, psychotherapy notes that document or analyze conversations in therapy are kept separate from other patient documentation. Psychologists may choose whether or not to release psychotherapy notes to a client unless state law requires it. See the study manual for more information on how HIPAA views psychotherapy notes.

Answer A: This answer is incorrect. Psychotherapy notes are kept separately from information needed to bill insurance.

Answer B: Psychotherapy notes are not considered part of the clinical record that is released to clients, unless state law requires it.

Answer D: This answer does not accurately describe the role and function of psychotherapy notes under HIPAA.

Marked out of 1.00

Question ID #11098: Your client has a fear of flying. You suggest that he goes to the airport and watches planes take off and land. This is an example of which of the following techniques?

Select one:

- ☐ A. Imaginal exposure
- ☐ B. Virtual reality exposure
- ☐ C. In vivo exposure
- ☐ D. Covert sensitization

The correct answer is C.

As a therapeutic intervention, in vivo exposure involves exposure to real-life events, objects, and/or scenarios.

Answer A: In imaginal exposure, an individual mentally confronts a fear or situation by picturing it in one's mind.

Answer B: Therapy with virtual reality exposure may incorporate computer graphics, visual displays, and sensory inputs to create an immersive virtual environment.

Answer D: Covert sensitization is a type of aversion therapy that uses imagery. Covert sensitization uses counterconditioning in imagination (versus in vivo) in order to reduce or eliminate an undesirable behavior.

Question 189

Marked out of 1.00

Question ID #10666: In teaching a psychology graduate course in ethics, one of Dr. Frank's students asks what is the best way to predict whether a therapist will have a sexual relationship with a client. Dr. Frank should reply that _____.

Select one:

- ☐ A. it is impossible to answer this question
- ☐ B. research results suggest therapists of particular theoretical orientations are more likely to have sex with their clients
- ☐ C. male therapists are at higher risk than female therapists
- ☐ D. inexperienced therapists are at higher risk than experienced therapists

The correct answer is C.

Pope et al.'s (1993) study found that male therapists were more likely to engage in sexual relationships with their clients than female therapists.

Answer A: Pope et al.'s (1993) work in this area is often quoted as a means of shedding some light on this question.

Answer B: There has been no relationship established between theoretical orientation and a therapist's likelihood of engaging in a sexual relationship with a client.

Answer D: There has been no relationship established between a therapist's level of experience and the likelihood of engaging in a sexual relationship with a client.

Question 190

Not answered

Marked out of 1.00

Question ID #13360: What is the best way to avoid criterion contamination?

Select one:

- ☐ A. Ensure the individual who is rating people on a criterion measure is not familiar with their performance on the predictor.
- ☐ B. Ensure the criterion data are collected prior to or at about the same time as the data on the predictor.
- ☐ C. Ensure there are two equivalent forms of the test being used to collect data on a criterion measure.
- ☐ D. Ensure the data collected in the validity study are used to construct a scatterplot.

The correct answer is A.

Criterion contamination refers to the bias introduced into a person's criterion score as a result of the scorer's knowledge of the person's performance on the predictor. For example, if a manager knows employees' predictor scores when rating their job performance, the ratings may be affected by the knowledge. The best way to avoid criterion contamination is to ensure the individual who is rating people on a criterion measure is not familiar with their performance on the predictor.

Answer B: This describes concurrent validity, or the collection of criterion data prior to or at about the same time as data on the predictor.

Answer C: When two equivalent forms of a test are administered and the two sets of scores are correlated, the resulting coefficient is known as the alternate forms reliability coefficient or the coefficient of equivalence. This is a measure of reliability, not validity.

Answer D: To evaluate a predictor's incremental validity, the first step is to use data collected in a validity study to construct a scatterplot. Incremental validity refers to the degree to which a test improves decision-making accuracy, and it is not used to decrease criterion contamination.

Question 191

Marked out of 1.00

Question ID #11925: Which of the following is a similarity between Piaget's and Vygotsky's theories of cognitive development?

Select one:

- ☐ A. Knowledge is constructed through social interaction.
- ☐ B. The endpoint of cognitive development is formal operational thought.
- ☐ C. Teachers are seen as facilitators and guides.
- ☐ D. Teachers are seen as directors and molders of learning.

The correct answer is C.

Both Piaget and Vygotsky emphasized the role of teachers as someone who can facilitate cognitive growth and development. Vygotsky highlighted the role of scaffolding in assisting children with advancing to the next level and promoting self-regulatory learning. Piaget viewed the teacher as an organizer who guides stimulating plans and provides opportunities for children to experience disequilibrium, which fosters curiosity and adaptation.

Answer A: Although Piaget appreciated the role of active interaction for opportunities to promote disequilibrium and subsequent growth, social interaction is more central to Vygotsky's school of thought than Piaget's.

Answer B: This is Piaget's concept and is not a view that Vygotsky shared.

Answer D: This is not a thought that Vygotsky and Piaget shared. With both theories, the child was an active learner and adults/teachers are more like guides who provide experiences that foster growth and development.

Question 192

Not answered

Marked out of 1.00

Question ID #10626: Dr. Chen's new client mentions she is seeing another therapist on Tuesdays but would like to work with Dr. Chen on Thursdays to help her "get through the week." Dr. Chen should _____.

Select one:

- ☐ A. require the client to sign a release so Dr. Chen can talk with the other therapist
- ☐ B. tell the client she is unable to work with her since she is already seeing another therapist
- ☐ C. tell the client she will need to terminate her treatment with the other therapist before Dr. Chen can work with her on a regular basis
- ☐ D. discuss the issue further with the client

The correct answer is D.

Standard 10.04 states that "in deciding whether to offer or provide services to those already receiving mental health services elsewhere, psychologists carefully consider the treatment issues and the potential client's/patient's welfare. Psychologists discuss these issues with the client patient...and proceed with caution."

Answer A: While it is a good idea to have the client sign a release so Dr. Chen could consult with the other therapist, this answer does not reflect what is required by the ethics code.

Answer B: The ethics code does not state this.

Answer C: This answer does not align with the language in the APA's Ethics Code.

Question 193

Marked out of 1.00

Question ID #13946: A young man has just received a diagnosis of Narcissistic Personality Disorder. You can expect that he will display which of the following?

Select one:

- ☐ A. Rapidly changing and shallow expression of emotions
- ☐ B. Instability in self-image, interpersonal relationships, and mood
- ☐ C. Grandiose behavior and a lack of empathy
- ☐ D. Excessive emotionality and attention seeking

The correct answer is C.

Narcissistic Personality Disorder involves a pervasive pattern of grandiosity, a need for admiration, and a lack of empathy.

Answer A: Rapidly changing and shallow expression of emotions are characteristic of Histrionic Personality Disorder.

Answer B: Instability in self-image, interpersonal relationships, and mood are characteristic of Borderline Personality Disorder.

Answer D: Excessive emotionality and attention seeking are characteristic of Histrionic Personality Disorder.

Question 194

Not answered

Marked out of 1.00

Question ID #10650: According to the APA's Ethics Code, if a client does not pay a psychologist for services as agreed, the psychologist _____.

Select one:

- ☐ A. should write off the uncollected fees, as collecting them will be more expensive to the client and the therapist
- ☐ B. should write off the uncollected fees, as collecting them may be exploitative to the client
- ☐ C. must inform the client that a collection agency will be used to collect the fees
- ☐ D. must obtain a client's permission before using a collection agency to collect the fees

The correct answer is C.

Standard 6.04 states that "if the recipient of services does not pay for services as agreed, and if psychologists intend to use collection agencies or legal measures to collect the fees, psychologists first inform the person that such measures will be taken and provide that person the opportunity to make prompt payment."

Answer A: While a psychologist may opt to simply write off the unpaid fees, this answer does not address the language used in the APA's Ethics Code.

Answer B: The Ethics Code does not recommend this action.

Answer D: The psychologist is not required to obtain the client's permission to use a collection agency.

Question 195

Not answered

Marked out of 1.00

Question ID #13351: When a test's reliability coefficient is equal to _____, this means that 81% of variability in test scores is attributable to true score variability.

Select one:

- ☐ A. 0.9
- ☐ B. 0.81
- ☐ C. 0.65
- ☐ D. 0.19

The correct answer is B.

When the reliability coefficient is equal to .81, this means that 81% of variability in test scores reflects true score variability and 19% reflects measurement error.

Answers A, C, & D are incorrect.

Question 196

Not answered

Marked out of 1.00

Question ID #10657: The APA's Ethics Code allows barter when:

Select one:

- ☐ A. it is not clinically contraindicated
- ☐ B. it is not exploitative or clinically contraindicated
- ☐ C. only in communities where barter for services is a common practice
- ☐ D. only in communities where barter for services is a common practice and it is not exploitative or clinically contraindicated

The correct answer is B.

Standard 6.05 states that "psychologists may engage in barter for their services only when (1) it is not clinically contraindicated, and (2) the resulting arrangement is not exploitative."

Answer A: This answer is incomplete because it does not include the second condition under which psychologists may engage in barter.

Answer C: This answer is not part of the conditions included in the APA's Ethics Code.

Answer D: The APA's Ethics Code does not include a provision related to communities where barter is a common practice.

Question 197

Marked out of 1.00

Question ID #10552: You have been working with Justine as a client for three months. She tells you suddenly that this will be her last session. You believe this is not a good time for Justine to stop therapy and are concerned about the implications of her decision. You should

Select one:

- ☐ A. discuss with her the reasons you believe she should continue and recommend that she reconsider her decision
- ☐ B. allow the client to terminate
- ☐ C. offer the client with three or more referrals
- ☐ D. inform Jessica that you are not responsible for any negative repercussions associated with terminating prematurely

The correct answer is A.

This is the best response of those given. In this situation, the psychologist would want to discuss the possible risks of terminating therapy at this time and encourage the client to reconsider her decision.

Answer B: Obviously, a client has a right to discontinue treatment. This creates an ethical dilemma, however, when the psychologist believes that termination is ill-advised.

Answer C: Although the action described in this response would also be important, it should follow a discussion about the possible consequences of leaving.

Answer D: Discussing the risks of terminating therapy at this time and documenting that conversation is the more appropriate decision.

Question 198

Marked out of 1.00

Question ID #12684: Universal symbols in the delusions and hallucinations of psychotic patients would be of most interest to:

Select one:

- ☐ A. Perls
- ☐ B. Sullivan
- ☐ C. Adler
- ☐ D. Jung

The correct answer is D.

The term "universal symbols" should have helped you recognize the correct answer to this question. Of the individuals listed, only Jung incorporates the notion of universal symbols into his work. When working with psychotic patients, Jung noticed a great deal of similarity in the content of their delusions and hallucinations, and this led to the development of his theory of archetypes and the collective unconscious.

Answer A: Perls did not work with universal symbols in the delusions and hallucinations of psychotic patients. See explanation for answer D.

Answer B: Sullivan did not work with universal symbols in the delusions and hallucinations of psychotic patients. See explanation for answer D.

Answer C: Adler did not work with universal symbols in the delusions and hallucinations of psychotic patients. See explanation for answer D.

Question 199

Not answered

Marked out of 1.00

Question ID #13929: _____ is based on the assumption that illness can arise from either natural or supernatural forces that affect physical, emotional, and/or spiritual functioning.

Select one:

- ☐ A. Ho'oponopono
- ☐ B. Ataque de Nervios
- ☐ C. Marianismo
- ☐ D. Curanderismo

The correct answer is D.

Curanderismo is a holistic system of healing that is practiced in some Latin American countries and Hispanic American communities in the United States. It is based on the assumption that illness can arise from either natural or supernatural forces that affect physical, emotional, and/or spiritual functioning.

Answer A: Ho'oponopono is a traditional Hawaiian spiritual healing ritual for restoring harmony among family members by resolving a current conflict or other interpersonal problem.

Answer B: This is a specific culture-bound syndrome.

Answer C: This term refers to a traditional feminine gender role common in some Latino cultures.

Question 200

Not answered

Marked out of 1.00

Question ID #10595: According to the APA Publication Manual, which of the following should be used in referring to a client?

Select one:

- ☐ A. A wheelchair bound woman
- ☐ B. A wheelchair bound female
- ☐ C. A female who uses a wheelchair
- ☐ D. A woman who uses a wheelchair

The correct answer is D.

The Publication Manual offers specific recommendations for avoiding bias in language. Saying "a woman who uses a wheelchair" places the person first and correctly uses "woman" rather than "female" as a noun. See the Study Guide for additional information on this topic.

Answer A: This answer is incorrect, because it does not use person first language.

Answer B: This answer does not use person first language, and it uses "female" as a noun rather than as an adjective.

Answer C: While this answer uses person first language, it is incorrect because it refers to a woman as a female.

Question 201

Not answered

Marked out of 1.00

Question ID #12839: Which statement regarding intellectual gender differences does not have standing in previous research?

Select one:

- ☐ A. Gender differences regarding spatial skills are purely genetic.
- ☐ B. Females are less likely than males to have a reading disability.
- ☐ C. Gender differences tend to be small.
- ☐ D. Gender differences have declined in recent years.

The correct answer is A.

Although males and females do not differ significantly in terms of average performance on IQ tests, there are some gender-related differences in specific abilities. Males are noted to outperform females on measures of certain spatial and math skills, with spatial skills showing the largest gender gap. Although there is evidence that these differences may have a biological basis, some investigators point out that environmental factors also play a role, noting that boys are encouraged to spend more time than girls engaged in activities that develop related skills.

Answer B: Investigators have determined females do better than males on some measures of verbal ability, especially during the school years, and are less likely than males to have a reading disability.

Answer C: Investigators have noted that gender differences in intellectual abilities tend to be small.

Answer D: Researchers investigating gender differences in intellectual abilities indicated that these differences have declined in recent years.

Question 202

Not answered

Marked out of 1.00

Question ID #13516: Malingering involves the intentional production of _____ symptoms to obtain an external reward.

Select one:

- ☐ A. somatic
- ☐ B. psychosomatic
- ☐ C. psychological
- ☐ D. physical or psychological

The correct answer is D.

In the DSM-5, malingering is classified with Other Conditions That May Be a Focus of Clinical Attention. It involves the intentional production of physical or psychological symptoms to obtain an external reward.

Answers A, B, and C: These responses are incorrect as the definition of malingering includes the production of physical or psychological symptoms.

Question 203

Not answered

Marked out of 1.00

Question ID #12876: According to the base rate fallacy, which type of information is downplayed when making evaluations and judgments?

Select one:

- ☐ A. Complex information
- ☐ B. Specific information
- ☐ C. False information
- ☐ D. General information

The correct answer is D.

The base-rate fallacy involves paying particular attention to quite specific information in making judgments and evaluations, while ignoring general (base-rate) information.

Answers A, B, and C: The correct answer is general information.

Question 204

Marked out of 1.00

Question ID #14412: Messages within a neuron are transmitted from a neuron's dendrites to the end of its axon through an electrical process called _____.

Select one:

- ☐ A. depolarization
- ☐ B. action potential
- ☐ C. conduction
- ☐ D. synaptic transmission

The correct answer is C.

Conduction is the passage of a nerve impulse along a nerve fiber.

Answer A: Depolarization is the reduction of the membrane potential of a cell from its normal resting state.

Answer B: Action potential is the brief electrical impulse that provides the basis for conduction of information along an axon.

Answer D: Synaptic transmission is the transmission of information from one nerve cell to another, is usually chemically mediated, and occurs when the action potential reaches the axon terminal.

Question 205

Not answered

Marked out of 1.00

Question ID #13450: Which of the following is not considered an intrusion symptom?

Select one:

- ☐ A. Recurrent, involuntary, and distressing memories
- ☐ B. Recurrent distressing dreams
- ☐ C. Dissociative reactions
- ☐ D. An altered sense of the reality of one's surroundings

The correct answer is D.

Symptoms of PTSD and Acute Stress Disorder fall within the following five categories: intrusion, negative mood, dissociation, avoidance, and arousal. All of the responses are intrusion symptoms except for answer D. An altered sense of the reality of one's surroundings is a dissociative symptom.

Answers A, B, and C: These responses are incorrect as they are all intrusion symptoms.

Question 206

Not answered

Marked out of 1.00

Question ID #12510: A psychologist is hired to develop a community program for seniors that will focus on maintaining social contacts and reducing the risk of social isolation. This program is an example of which of the following?

Select one:

- ☐ A. Milestone prevention
- ☐ B. Primary prevention
- ☐ C. Secondary prevention
- ☐ D. Tertiary prevention

The correct answer is B.

In this situation, a program is being developed for a particular population rather than specific individuals from that population. Since this program is aimed at all seniors in the community, it is a primary prevention.

Answer A: Bloom (1968) distinguishes between community-wide, milestone, and high-risk preventions. Milestone programs are aimed at people experiencing a transition (e.g., retirement).

Answer C: A secondary prevention would be aimed at specific individuals who have been identified as being at high-risk. As originally defined, secondary prevention always involves some kind of screening process to identify individuals.

Answer D: A tertiary program is for people who have already suffered mental health problems. Its purpose is to reduce the risk for relapse or a continuation or worsening of the problem.

Question 207

Not answered

Marked out of 1.00

Question ID #10880: In cognitive therapy it is believed that, _____ are frequent, persistent, and not critically examined.

Select one:

- ☐ A. traits
- ☐ B. cognitive distortions
- ☐ C. schemas
- ☐ D. automatic thoughts

The correct answer is D.

Automatic thoughts are surface-level cognitions that contribute to dysfunction and result from maladaptive schema.

Answer A: Traits are enduring personality characteristics that describe or determine an individual's behavior across a range of situations.

Answer B: Cognitive distortions are systematic errors or biases in information processing and are the link between maladaptive cognitive schemas and negative automatic thoughts.

Answer C: Schemas are underlying cognitive structures and rules that consist of core beliefs and determine how individuals categorize and interpret experiences.

Question 208

Not answered

Marked out of 1.00

Question ID #12881: "A systematic pattern of deviation from norm or rationality in judgment," whereby a person creates a subjective reality which determines their behavior, is known as a:

Select one:

- ☐ A. wishful thinking
- ☐ B. irrational worldview
- ☐ C. cognitive dissonance
- ☐ D. cognitive bias

The correct answer is D.

A cognitive bias is systematic pattern of deviation from rationality in judgment which influences one's behavior in the world.

Answers A, B, and C: These do not describe the concept of cognitive bias.

Question 209

Not answered

Marked out of 1.00

Question ID #13831: Children with Tourette's Disorder often have symptoms of ADHD. In addition, they most often exhibit which of the following?

Select one:

- ☐ A. Obsessions and compulsions
- ☐ B. Separation anxiety
- ☐ C. Conduct problems
- ☐ D. Below-average IQ

The correct answer is A.

The most common comorbid symptoms for Tourette's Disorder are obsessions and compulsions and symptoms of ADHD.

Answer B & C: While these disorders may co-occur with Tourette's Disorder, they are not the most commonly co-occurring disorders for this syndrome.

Answer D: Tourette's syndrome does not lessen one's intelligence.

Question 210

Not answered

Question ID #13475: A diagnosis of Reactive Attachment Disorder cannot be assigned without the presence of which of the following?

Select one:

- ☐ A. Evidence of extreme insufficient care
- ☐ B. Developmentally inappropriate social relatedness that began prior to age 2
- ☐ C. A pattern of inappropriate social relatedness in at least two settings
- ☐ D. The presence of one or more developmental delays

The correct answer is A.

Reactive Attachment Disorder is characterized by inappropriate social relatedness that is related to extreme insufficient (pathogenic) care.

Answer B: The diagnosis requires that symptoms begin prior to age 5 (not age 2).

Answer C: The diagnosis does not require signs of inappropriate social relatedness in at least two settings.

Answer D: Developmental delays are not required for the diagnosis.

Question 211

Not answered

Marked out of 1.00

Question ID #13480: The duration of Brief Psychotic Disorder is:

Select one:

- ☐ A. one day to less than one week
- ☐ B. one day to less than one month
- ☐ C. three days to less than one month
- ☐ D. one week to less than one month

The correct answer is B.

Brief Psychotic Disorder involves one or more characteristic symptoms (delusions, hallucinations, disorganized speech, grossly disorganized or catatonic behavior), with at least one symptom being delusions, hallucinations, or disorganized speech. Symptoms have a duration of one day to less than one month.

Answers A, C, and D: These responses are incorrect as the correct duration for a diagnosis of Brief Psychotic Disorder is one day to less than one month.

Question 212

Not answered

Marked out of 1.00

Question ID #14403: Problems involving sensation in the inner forearm and the ring and little fingers are most likely due to spinal injury at the _____ level.

Select one:

- ☐ A. L1
- ☐ B. S1 to S4
- ☐ C. C8 to T1
- ☐ D. T2 to T12

The correct answer is C.

The spinal cord is divided into four regions - from top to bottom, these are cervical, thoracic, lumbar, and sacral. T1 is the first segment of the thoracic spinal cord and contains nerves that innervate the forearm and C8 and innervates the ring and little fingers.

Answer A: The lumbar region of the spine contains nerves that connect to the thigh, hip, and leg.

Answer B: The sacral region contains nerves that innervate the foot and the posterior and lateral aspects of the leg.

Answer D: T2 through T12 innervate the trunk.

Question 213

Not answered

Marked out of 1.00

Question ID #13972: The primary purpose of "informed consent" is best defined as:

Select one:

- ☐ A. providing a client with the information needed to make a reasonable decision about the services offered
- ☐ B. providing a client with information about the particular situations in which confidentiality may be breached
- ☐ C. ensuring that a client is provided with appropriate and adequate services
- ☐ D. protecting the practitioner from malpractice claims

The correct answer is A.

An informed consent should be obtained prior to providing psychological services to an individual and prior to a subject's participation in research. This question is pretty straightforward. The goal of an informed consent is to protect the recipient of psychological services (or subjects in research studies) by providing them with the information they need to make an informed decision about whether or not to participate.

Answer B: Detailing the limitations of confidentiality is only one part of informed consent.

Answer C: This does not define the purpose of informed consent.

Answer D: This is arguably the least important purpose of informed consent, the most important being protecting client welfare.

Question 214

Not answered

Marked out of 1.00

Question ID #13002: In comparison to White middle-class families, African American middle-class families:

Select one:

- ☐ A. are more likely to have a patriarchal structure
- ☐ B. are more likely to have a matriarchal structure
- ☐ C. are less likely to include members of the extended family
- ☐ D. are less likely to exhibit differentiation in power along gender lines

The correct answer is D.

The studies have confirmed that a difference between middle-class African American and White families is that African American families are less rigid with regard to gender roles. Although White middle-class families are generally less rigid about gender roles than they were in the past, this is still considered a characteristic that distinguishes African American and White middle-class families.

Answer A: The answer, "are more likely to have a patriarchal structure", is incorrect. See explanation for response D.

Answer B: The answer, "are more likely to have a matriarchal structure", is incorrect. See explanation for response D.

Answer C: The answer, "are less likely to include members of the extended family", is the opposite of what is true.

Question 215

Not answered

Marked out of 1.00

Question ID #11766: Which of the following statements about authoritative parents is not true?

Select one:

- ☐ A. They provide warmth and parental involvement.
- ☐ B. They establish an appropriate balance between control and autonomy.
- ☐ C. They are likely to encourage expression of adolescents' views.
- ☐ D. Their children are less receptive to parental influences than other styles of parenting.

The correct answer is D.

Children with secure attachment styles are more receptive to parental influence because they have fostered a warm relationship while setting boundaries. They rely on reasoning, praise, explanations, and other inductive techniques to gain compliance, and they encourage independence.

Answer A: This is one of the core features of an authoritative parenting style.

Answer B: This is central to an authoritative parenting style.

Answer C: Authoritative parents encourage independence.

Question 216

Not answered

Marked out of 1.00

Question ID #12902: The use of the Pearson r and most other correlation coefficients require that three assumptions be met, or inaccurate and misleading correlation coefficients will be produced. These assumptions are ____.

Select one:

- ☐ A. linearity, an unrestricted range of scores for both variables, and homoscedasticity
- ☐ B. linearity, a restricted range of scores for both variables, and homoscedasticity
- ☐ C. linearity, an unrestricted range of scores for both variables, and heteroscedasticity
- ☐ D. linearity, an unrestricted range of scores for one variable, and heteroscedasticity

The correct answer is A.

The three assumptions for the use of the Pearson r or other correlation coefficients are: linearity, an unrestricted range on scores for both variables, and homoscedasticity.

Answer B: One of the assumptions requires an unrestricted range on scores for both variables instead of a restricted range of scores. If there is a restriction in range (if the people are homogeneous), the Pearson r is likely to be an underestimate.

Answer C: One of the assumptions requires homoscedasticity and not heteroscedasticity. Violation of the assumption of homoscedasticity does not necessarily result in a coefficient that is too low or too high but produces a coefficient that does not represent the full range of scores.

Answer D: One of the assumptions requires homoscedasticity and not heteroscedasticity and requires an unrestricted range of scores for both variables.

Question 217

Not answered

Marked out of 1.00

Question ID #12905: In a normally shaped distribution, the percentile rank equivalent of a z-score of +2.0 is approximately_____.

Select one:

- ☐ A. 2.5
- ☐ B. 50
- ☐ C. 84
- ☐ D. 97.5

The correct answer is D.

If you can recall that about 68% of scores fall between +1.0 and -1.0 standard deviations from the mean, that 95% fall between +2.0 and -2.0 standard deviations from the mean, and that 99% fall between +3.0 and -3.0 standard deviations from the mean, you should be able to identify the correct answer to these types of questions. In a normal distribution, a percentile rank of 97.5 is equivalent to a z-score of about +2.0. Knowing that 50% of scores fall below the mean and that 47.5% of scores fall between the mean and the score that is 2 standard deviations above the mean would also helped you with identifying the correct answer to this question.

Answer A: A percentile rank of 2.5 is equivalent to a z-score of about -2.0.

Answer B: A percentile rank of 50.0 is equivalent to a z-score of 0.

Answer C: A percentile rank of 84 is equivalent to a z-score of +1.0.

Question 218

Not answered

Marked out of 1.00

Question ID #12838: Which type of scores permits comparisons of an examinee's score on one scale with their scores on other scales?

Select one:

- ☐ A. Content-referenced scores
- ☐ B. Criterion-referenced scores
- ☐ C. Self-referenced scores
- ☐ D. Norm-referenced scores

The correct answer is C.

Self-referenced scores are provided by ipsative scales, which permit intraindividual comparisons (i.e., comparisons of an examinee's score on one scale with his/her scores on other scales).

Answer A: Content-referenced scores are the same as criterion-referenced scores and permit interpreting an examinee's test performance in terms of what the examinee can do or knows with regard to a clearly defined content domain.

Answer B: Criterion-referenced scores are also known as domain-referenced and content-referenced scores and permit interpreting an examinee's test performance in terms of what the examinee can do or knows with regard to a clearly defined content domain or in terms of performance or status on an external criterion.

Answer D: Norm-referenced scores, such as percentile ranks and standard scores, permit comparisons between an examinee's test performance and the performance of individuals in the norm group.

Question 219

Not answered

Marked out of 1.00

Question ID #14396: Which type of aphasia is characterized by nonfluent, effortful speech, lack of spontaneous speech, and anomia with unimpaired repetition or comprehension?

Select one:

- ☐ A. transcortical motor aphasia
- ☐ B. global aphasia
- ☐ C. conduction aphasia
- ☐ D. Broca's aphasia

The correct answer is A.

Transcortical aphasia is caused by lesions outside Broca's and Wernicke's areas that disconnect these areas from other regions of the brain. If the damage isolates only Broca's area, then transcortical motor aphasia results. If the lesion isolates only Wernicke's area, the result is transcortical sensory aphasia, which involves deficits in comprehension, anomia, and fluent (but meaningless) speech with unimpaired repetition.

Answer B: Global aphasia is caused by widespread brain injury involving both Broca's and Wernicke's areas as well as other areas in the left frontal, temporal and parietal lobes. This type of aphasia is characterized by extensive disruption in the ability to produce and understand language.

Answer C: Damage to the arcuate fasciculus produces conduction aphasia. As a result, anomia, paraphasia, and impaired repetition occur.

Answer D: Broca's aphasia is caused by damage to Broca's area and is characterized by poorly articulated speech, dysprosody, and frequently omitted conjunctions, pronouns, and prepositions. Other difficulties include anomia, repeating phrases, and producing spoken and written language.

Question 220

Not answered

Marked out of 1.00

Question ID #10784: Which of the following is not true regarding informed consent?

Select one:

- ☐ A. It should be documented.
- ☐ B. It does not apply to people who are incapable of giving informed consent.
- ☐ C. It is necessary when an experimental treatment is given as part of a research study.
- ☐ D. It should include information about confidentiality.

The correct answer is B.

Note that this question asks which statement is NOT true. Standard 3.10 states "For persons who are legally incapable of giving informed consent, psychologists nevertheless (1) provide an appropriate explanation, (2) seek the individual's assent, (3) consider such persons' preferences and best interests, and (4) obtain appropriate permission from a legally authorized person."

Answer A: Informed consent should be documented according to Standard 3.10.

Answer C: Informed consent is required in most research studies where participants are involved and always when an experimental treatment is administered.

Answer D: Standard 3.10 specifies that informed consent should include information about confidentiality.

Question 221

Not answered

Marked out of 1.00

Question ID #13881: Because of a series of misbehaviors, your adolescent daughter has been restricted from participating in a number of activities over the next few months. To increase her positive behavior, you decide to remove a restriction each time she engages in one of the desired behaviors. This is an example of:

Select one:

- ☐ A. positive punishment
- ☐ B. negative reinforcement
- ☐ C. response cost
- ☐ D. shaping

The correct answer is B.

In this situation, you are removing a stimulus to increase a behavior. Removal of a stimulus (e.g., a restriction) after a behavior in order to increase the behavior is an example of negative reinforcement.

Answer A: Positive punishment occurs when a behavior decreases because of the application of a stimulus following the behavior. The question asks what is being used to increase (not decrease) the daughter's behavior, so punishment cannot be the correct answer.

Answer C: Response cost is an application of negative punishment that is used to eliminate an undesirable behavior by imposing a penalty or fine (i.e., removing a specific stimulus) whenever the undesirable behavior occurs.

Answer D: Shaping is a type of positive reinforcement and involves applying, not removing, a stimulus following a behavior in order to increase that behavior.

Question 222

Not answered

Marked out of 1.00

Question ID #13963: As it relates to the prevalence of psychiatric disorders across Latino subgroups in the United States, Alegria et al. (2007) found:

Select one:

- ☐ A. increased rates of psychiatric disorders among US-born, English-language-proficient, and third-generation Latinos
- ☐ B. decreased rates of psychiatric disorders among US-born, English-language-proficient, and third-generation Latinos
- ☐ C. increased rates of psychiatric disorders among first-generation, Spanish-speaking Latino immigrants
- ☐ D. decreased rates of psychiatric disorders among English-language-proficient Latino immigrants

The correct answer is A.

Alegria et al. (2007) conducted a national study examining the prevalence of psychiatric disorders across Latino subgroups in the United States. These researchers found that stressors associated with cultural transmutation led to increased rates of psychiatric disorders among US-born, English-language-proficient, and third-generation Latinos. [Alegria M, Mulvaney-Day N, Torres M, Polo A, Cao Z, Canino G. Prevalence of psychiatric disorders across Latino subgroups in the United States. Am J Public Health. 2007 Jan;97(1):68-75. doi: 10.2105/AJPH.2006.087205. Epub 2006 Nov 30.]

Answer B: The opposite is true.

Answer C: Increased rates were found among third-generation, English-speaking Latino immigrants.

Answer D: Increased rates of psychiatric disorders were observed among this population.

Question 223

Not answered

Marked out of 1.00

Question ID #13805: Cognitive preparation, skills acquisition and rehearsal, and application and follow-through are the three phases of which of the following interventions?

Select one:

- ☐ A. Self-control therapy
- ☐ B. Self-instructional training
- ☐ C. Attribution retraining
- ☐ D. Stress inoculation training

The correct answer is D.

Stress inoculation was designed to help people deal effectively with stress by enhancing their coping skills. It consists of the three phases listed in this question (cognitive preparation, skills acquisition, and application and follow-through).

Answer A: Rehm's self-control therapy is based on the assumption that deficits in three aspects of self-control can increase a person's vulnerability to depression. Self-monitoring, self-evaluation, and self-reinforcement are the three targets of self-control therapy.

Answer B: Self-instructional training helps impulsive and hyperactive children insert adaptive, self-controlling thoughts between a stimulus situation and their response to that situation.

Answer C: Attribution retraining focuses on altering individuals' perceptions of the causes of their problematic behavior.

Question 224

Not answered

Marked out of 1.00

Question ID #12872: Which of the following is NOT considered to be one of the three components of attitudes?

Select one:

- ☐ A. Behavior
- ☐ B. Cognition
- ☐ C. Affect
- ☐ D. Personality

The correct answer is D.

The three components of attitudes are affect, behavior, and cognition. Personality is not thought of as a component of attitudes.

Answers A, B, and C: These are identified as the three components of attitudes.

Question 225

Not answered

Marked out of 1.00

Question ID #10536: Dr. Jenkins had been working with a client who died by suicide three days after her last therapy appointment. The client's family is suing Dr. Jenkins for malpractice. In order for the court to find Dr. Jenkins has been negligent, the family's attorney must prove _____.

Select one:

- ☐ A. Dr. Jenkins's reckless disregard caused the suicide
- ☐ B. Dr. Jenkins's gross incompetence caused the suicide
- ☐ C. Dr. Jenkins's callous disregard caused the suicide
- ☐ D. Dr. Jenkins's breach of duty caused the suicide

The correct answer is D.

In order to prove negligence, a court must determine that the psychologist's breach of duty was the proximate cause of the person's harm or injury.

Answer A: Malpractice does not require reckless disregard.

Answer B: Malpractice does not require gross incompetence.

Answer C: Malpractice does not require callous disregard.
